

ON THE BIREGULAR GEOMETRY OF FULTON-MACPHERSON CONFIGURATION SPACES

ALEX MASSARENTI

ABSTRACT. Let $X[n]$ be the Fulton-MacPherson configuration space of n ordered points on a smooth projective variety X . We prove that if either $n \neq 2$ or $\dim(X) \geq 2$, then the connected component of the identity of $\text{Aut}(X[n])$ is isomorphic to the connected component of the identity of $\text{Aut}(X)$. When $X = C$ is a curve of genus $g(C) \neq 1$ we classify the dominant morphisms $C[n] \rightarrow C[r]$, and thanks to this we manage to compute the whole automorphism group of $C[n]$, namely $\text{Aut}(C[n]) \cong S_n \times \text{Aut}(C)$ for any $n \neq 2$, while $\text{Aut}(C[2]) \cong S_2 \ltimes (\text{Aut}(C) \times \text{Aut}(C))$. Furthermore, we extend these results on the automorphisms to the case where $X = C_1 \times \dots \times C_r$ is a product of curves of genus $g(C_i) \geq 2$. Finally, using the techniques developed to deal with Fulton-MacPherson spaces, we study the automorphism groups of some Kontsevich moduli spaces $\overline{M}_{0,n}(\mathbb{P}^N, d)$.

INTRODUCTION

The search for a natural compactification of the configuration space of n distinct ordered points in a smooth algebraic variety X has been a long-standing problem in algebraic geometry. In [FM94] W. Fulton and R. MacPherson constructed such compactification $X[n]$ from the Cartesian product X^n by a sequence of blow-ups. For instance, when $n = 2$ the Fulton-MacPherson compactification $X[2]$ is the blow-up of $X \times X$ along the diagonal, which has been the natural candidate since the nineteenth century. By [FM94] $X[n]$ is a smooth, irreducible variety.

Since then the compactification $X[n]$ has been widely studied and generalized by means of the theory of wonderful compactifications [DP95], [Li09], [MP98]. Indeed, $X[n]$ is the wonderful compactification of the set of all diagonals in X^n .

Key words and phrases. Fulton-MacPherson configuration spaces, Kontsevich moduli spaces, fibrations, automorphisms.

The Fulton-MacPherson configuration space $C[n]$ of n ordered points in a smooth projective curve C is closely related to the Deligne-Mumford compactification $\overline{M}_{g,n}$ of the moduli space of smooth curves of genus g with n -marked points.

Indeed, by [KM98] $\overline{M}_{0,n}$ is the GIT quotient $\mathbb{P}^1[n]//PGL(2)$ with respect to a suitable linearization, and its birational geometry is closely related to the geometry of $\overline{M}_{0,n}$ [HK00, Section 3]. Furthermore, if $g(C) \geq 3$ then $C[n]$ appears as the general fiber of the forgetful morphism $\overline{M}_{g,n} \rightarrow \overline{M}_g$.

Moreover, $\mathbb{P}^1[n]$ is related to another important class of moduli spaces, namely the Kontsevich moduli spaces parametrizing stable maps introduced by M. Kontsevich in [Ko95].

These spaces are denoted by $\overline{M}_{g,n}(X, \beta)$ where X is a projective scheme and $\beta \in H_2(X, \mathbb{Z})$ is the homology class of a curve in X . A point in $\overline{M}_{g,n}(X, \beta)$ corresponds to a holomorphic map α from an n -pointed genus g curve C to X such that $\alpha_*([C]) = \beta$. If X is a homogeneous variety then there exists a smooth, irreducible Deligne-Mumford stack $\overline{\mathcal{M}}_{0,n}(X, \beta)$ whose coarse moduli space is $\overline{M}_{0,n}(X, \beta)$ [FP97].

We will deal mainly with the case $X = \mathbb{P}^N$, the class β is then completely determined by its degree and we will write $\beta = d[L]$, where $[L]$ is the class of a line in \mathbb{P}^N . The space $\overline{M}_{0,n}(\mathbb{P}^N, d)$ admits n evaluation maps $ev_i : \overline{M}_{0,n}(\mathbb{P}^N, d) \rightarrow \mathbb{P}^N$ associating to a stable map its value on the i -th marked point. Furthermore, when $d = N = 1$ the birational morphism $ev_1 \times \dots \times ev_n : \overline{M}_{0,n}(\mathbb{P}^1, 1) \rightarrow (\mathbb{P}^1)^n$ realizes $\overline{M}_{0,n}(\mathbb{P}^1, 1)$ as the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$.

The Picard group and the cones of divisors of $\overline{M}_{0,n}(\mathbb{P}^N, d)$ have been carefully analyzed by I. Coskun, J. Harris in J. Starr in [CHS09]. In Section 2, thanks to their description of $\text{Pic}(\mathbb{P}^1[n])$, we manage to classify base point free pencils on $\mathbb{P}^1[n] \cong \overline{M}_{0,n}(\mathbb{P}^1, 1)$. The first step of our argument consists in analyzing the birational and the projective geometry of $\mathbb{P}^1[3]$. This is a Fano variety obtained by blowing-up the small diagonal in $\mathbb{P}^1 \times \mathbb{P}^1 \times \mathbb{P}^1$, or equivalently three skew lines in \mathbb{P}^3 .

In particular, it is a Mori Dream Space so that its effective and nef cones are polyhedral, and we manage to compute its Mori cone. On the other hand, by [CT15, Corollary 1.4] we know that $\overline{M}_{0,n}$ is not a Mori Dream Space for n big enough. Since as soon as $n \geq 3$ there is a dominant morphism $\rho : \mathbb{P}^1[n] \rightarrow \overline{M}_{0,n}$, forgetting the map, [Ok16, Theorem 1.1] yields that $\mathbb{P}^1[n]$ is not a Mori Dream Space for n sufficiently big as well.

Nevertheless, the analysis of base point free pencils on $\mathbb{P}^1[3]$ will be the first step of an inductive argument that will lead us to the classification of dominant morphisms $\mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$ in Sections 2 and 3.

There are several natural morphisms $\mathbb{P}^1[n] \rightarrow \mathbb{P}^1$, namely the evaluation morphisms mentioned above, the forgetful morphisms $\pi_I : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[1] \cong \mathbb{P}^1$ forgetting the $n-1$ points labeled by the set I , and the morphisms $\pi_J \circ \rho : \mathbb{P}^1[n] \rightarrow \overline{M}_{0,4} \cong \mathbb{P}^1$, where $\rho : \mathbb{P}^1[n] \rightarrow \overline{M}_{0,n}$ forgets the map, and $\pi_J : \overline{M}_{0,n} \rightarrow \overline{M}_{0,4}$ forgets the $n-4$ points labeled by the set J . Note that by Remark 2.5 the evaluation map ev_i may be identified with the forgetful morphism π_I , with $I = \{1, \dots, n\} \setminus \{i\}$. We call modular base point free pencils the linear systems associated to these morphisms, see Definition 2.6.

Furthermore, there are forgetful morphisms $\pi_I : X[n] \rightarrow X[r]$ forgetting $n-r$ of the points, these are just the liftings of the projections $X^n \rightarrow X^r$ to the blow-ups.

The main results on fibrations in Propositions 2.10, 3.1, 3.7, Theorem 3.4, and Corollary 3.5 can be summarized with the following statement:

Theorem 1. *Let $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r_1] \times \dots \times \mathbb{P}^1[r_k]$ be a dominant morphism. If $r_i \geq 3$ for some $i = 1, \dots, k$ we assume in addition that ψ has connected fibers. Then ψ factors through a product of forgetful morphisms of type π_I and $\pi_J \circ \rho$. Finally, if $r_i \geq 3$ for any $i = 1, \dots, k$ then ψ factors through a product of forgetful morphisms of type π_I only.*

Let C be a smooth projective curve of genus $g(C) \geq 2$, and $\psi : C[n] \rightarrow C[r_1] \times \dots \times C[r_k]$ be a dominant morphism. As before, if $r_i \geq 3$ for some $i = 1, \dots, k$ we assume in addition that ψ has connected fibers. Then ψ factors through a product of forgetful morphisms.

Note that for curves of genus one, or more generally for abelian varieties Theorem 1 does not hold. Indeed, if A is an abelian variety the multiplication map $A \times A \rightarrow A$ does not factor through one of the projections.

In Section 4 we study the automorphism groups of $X[n]$ and of some Kontsevich moduli spaces $\overline{M}_{0,n}(\mathbb{P}^N, d)$. In several cases, automorphisms of moduli spaces tend to be modular, in the sense that they can be described in terms of the objects parametrized by the moduli spaces themselves. See for instance, [BM13], [Ma14], [MaM14], [MaM15], [FaM15], [Lin04], [Lin11], [Ro71] for moduli spaces of pointed and weighted curves introduced by B. Hassett in [Has03], [BGM13] for moduli spaces of vector bundles over a curve, and [BM16] for generalized quot schemes. We confirm this behavior also for Fulton-MacPherson, and for some Kontsevich moduli spaces.

Thanks to a result due to M. Brion [Br11] in the algebraic setting, and to A. Blanchard [Bl56] in the analytic setting we compute the connected component of the identity of $\text{Aut}(X[n])$. Furthermore, as an application of Theorem 1 we manage to control the discrete part of $\text{Aut}(C[n])$. The main results on the automorphism groups in Propositions 4.8, 4.11, and Theorem 4.9 may be summarized as follows:

Theorem 2. *Let $X[n]$ be the Fulton-MacPherson configuration space of n ordered points on a smooth projective variety X . If either $n \neq 2$ or $\dim(X) \geq 2$, then the connected component of the identity of $\text{Aut}(X[n])$ is isomorphic to the connected component of the identity of $\text{Aut}(X)$, that is*

$$\text{Aut}^o(X[n]) \cong \text{Aut}^o(X)$$

for any n , and if $X = C$ is a curve then $\text{Aut}^o(C[2]) \cong \text{Aut}^o(C) \times \text{Aut}^o(C)$.

Furthermore, if $X = C$ is a curve with $g(C) \neq 1$ then we have

$$\text{Aut}(C[n]) \cong S_n \times \text{Aut}(C)$$

if $n \neq 2$, while $\text{Aut}(C[2]) \cong S_2 \ltimes (\text{Aut}(C) \times \text{Aut}(C))$.

Note that Theorem 2 does not hold if C has genus one. For instance, in this case by Remark 4.12 the group $GL(2, \mathbb{Z})$ of matrices with integers entries and determinant plus or minus one acts on $C \times C$.

In Corollary 4.14, thanks to Theorem 2, we get a simple proof of the main result on the automorphisms of $\overline{M}_{g,n}$ in [Ma14] when $g \geq 3$.

Furthermore, in Proposition 4.13 we extend these techniques to the case when $X = C_1 \times \dots \times C_r$ is a product of curves of genus $g(C_i) \geq 2$, and to some Kontsevich moduli spaces and moduli stacks. The results on products of curves in Lemma 4.6 and Proposition 4.13 can be summarized as follows:

Theorem 3. *Let $X = C_1 \times \dots \times C_r$ be a product of curves with $g(C_i) \geq 2$ for any $i = 1, \dots, r$, and let $[C_{r_1}], \dots, [C_{r_k}]$ be the isomorphism classes of curves in $\{C_1, \dots, C_r\}$, where r_i is the*

number of curves of class $[C_{r_i}]$. If $n \neq 2$ then

$$\mathrm{Aut}(X[n]) \cong S_n \times ((S_{r_1} \ltimes \mathrm{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \ltimes \mathrm{Aut}(C_{r_k})^{r_k})) \cong S_n \times \mathrm{Aut}(X)$$

while if $n = 2$ and $r \geq 2$ we have

$$\mathrm{Aut}(X[2]) \cong S_2^r \ltimes ((S_{r_1} \ltimes \mathrm{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \ltimes \mathrm{Aut}(C_{r_k})^{r_k})) \cong S_2^r \ltimes \mathrm{Aut}(X)$$

Finally, if $n = 2$ and $r = 1$ then $X = C_1$, and $\mathrm{Aut}(C_1[2]) \cong S_2 \ltimes (\mathrm{Aut}(C_1) \times \mathrm{Aut}(C_1))$.

In the following we summarize the results in this direction for Kontsevich spaces in Propositions 4.10, 4.15, and Corollary 4.17.

Theorem 4. *Let $\overline{\mathcal{M}}_{0,n}(\mathbb{P}^N, d)$ be the Deligne-Mumford stack of stable maps of degree d from an n -pointed rational curve to \mathbb{P}^N , and let $\overline{M}_{0,n}(\mathbb{P}^N, d)$ be its coarse moduli space. If $N \geq 2$ then*

$$\mathrm{Aut}^o(\overline{M}_{0,n}(\mathbb{P}^N, 1)) \cong \mathrm{PGL}(2) \times \mathrm{PGL}(N+1)$$

for any $n \neq 2$, and $\mathrm{Aut}^o(\overline{M}_{0,2}(\mathbb{P}^N, 1)) \cong \mathrm{PGL}(2) \times \mathrm{PGL}(2) \times \mathrm{PGL}(N+1)$.

Furthermore, for the Kontsevich spaces parametrizing rational normal curves we have:

$$\mathrm{Aut}^o(\overline{M}_{0,k}(\mathbb{P}^n, n)) \cong \mathrm{Aut}^o(\overline{\mathcal{M}}_{0,k}(\mathbb{P}^n, n)) \cong \mathrm{PGL}(n+1)$$

for any $n \geq 3$, and $k \geq n+2$.

The proofs of Theorems 2 and 4 work on an algebraically closed field of characteristic zero. However, by [FaM15, Lemma 1.2] these results can be easily extended on any field, not necessarily an algebraically closed one, of characteristic zero. Finally, in Conjecture 4.18 we propose a conjecture on $\mathrm{Aut}(X[n])$ when X is of general type.

The paper is organized as follows: in Section 1 we recall basic facts, and prove some preliminary results about Fulton-MacPherson and Kontsevich moduli spaces; Section 2 is devoted to the proof of the factorization results in Theorem 1; finally, in Section 4 we compute the automorphism groups in Theorem 2.

Acknowledgments. I thank Stéphane Druel for his useful comments and suggestions, particularly about Propositions 4.11 and 4.13, that helped me to improve a preliminary version of the paper.

The author is a member of the Gruppo Nazionale per le Strutture Algebriche, Geometriche e le loro Applicazioni of the Istituto Nazionale di Alta Matematica "F. Severi" (GNSAGA-INDAM).

1. FULTON-MACPHERSON CONFIGURATION SPACES AND KONTSEVICH MODULI SPACES

All through the paper we work on an algebraically closed field of characteristic zero. In [FM94] W. Fulton and R. MacPherson constructed a natural compactification of the configuration space of n distinct ordered points in a smooth algebraic variety X . The configuration space

$$\mathcal{C}(X, n) = X^n \setminus \bigcup_{1 \leq i, j \leq n} \Delta_{i,j}$$

is the complement in the Cartesian product X^n of the diagonals $\Delta_{i,j} = \{(x_1, \dots, x_n) \in X^n \mid x_i = x_j\}$. The Fulton-MacPherson compactification $X[n]$ of $\mathcal{C}(X, n)$ can be realized from X^n via a sequence of blow-ups, [FM94, Section 3].

1.1. Fulton-MacPherson blow-up construction of $X[n]$. Let us recall the construction of $X[n]$ given in [FM94, Section 3]. If $n = 1$ then $X[1] = X$, and if $n = 2$ we have that $X[2]$ is the blow-up $\pi_2 : X[2] \rightarrow X^2$ of X^2 along $\Delta_{1,2}$. Now, assuming that $\pi_{n-1} : X[n-1] \rightarrow X^{n-1}$ has already been constructed, $X[n]$ may be realized in the following way.

Construction 1.1. For any $S = \{i_1, \dots, i_s\} \subset \{1, \dots, n-1\}$ let $\Delta_S = \{(x_1, \dots, x_{n-1}) \in X^{n-1} \mid x_{i_1} = \dots = x_{i_s}\}$, and let $E_S \subset X[n-1]$ be the exceptional divisor over Δ_S . Finally, we denote by $p_i : X^{n-1} \rightarrow X$ the projections.

- Let $\tilde{E}_{1, \dots, n-1} = \{(y, x) \in X[n-1] \times X \mid (p_i \circ \pi_{n-1})(y) = x \ \forall i = 1, \dots, n-1\} \subset X[n-1] \times X$. Let $X[n-1]_1$ be the blow-up of $X[n-1] \times X$ along $\tilde{E}_{1, \dots, n-1}$.
- For any $S \subset \{1, \dots, n-1\}$ with $|S| = n-2$, let

$$\tilde{E}_S = \{(y, x) \in X[n-1] \times X \mid (p_i \circ \pi_{n-1})(y) = x \ \forall i \in S\} \subset X[n-1] \times X$$

Note that since $\tilde{E}_{1, \dots, n-1}$ has been blown-up in the preceding step the strict transforms in $X[n-1]_1$ of the \tilde{E}_S 's do not intersect. Let $X[n-1]_2$ be the blow-up of $X[n-1]_1$ along the strict transforms of the \tilde{E}_S 's. Note that the image of the exceptional divisor over the strict transform of \tilde{E}_S via the projection $X[n-1]_2 \rightarrow X^n$ is the diagonal $\Delta_{S \cup \{n\}}$.

- We repeat recursively the construction in the preceding step for any subset $S \subset \{1, \dots, n-1\}$ with $2 \leq |S| \leq n-3$ in order of decreasing cardinality of the set S , and we denote by $X[n-1]_u$ the variety obtained by this sequence of blow-ups.
- For any $i = 1, \dots, n-1$ we consider

$$\widetilde{X[n-1]_i} = \{(y, x) \in X[n-1] \times X \mid (p_i \circ \pi_{n-1})(y) = x\} \subset X[n-1] \times X$$

The projection $X[n-1] \times X \rightarrow X^n$ maps $\widetilde{X[n-1]_i}$ onto the diagonal $\Delta_{i, n}$. In order to get $X[n]$ we blow-up $X[n-1]_u$ along the strict transforms of the $\widetilde{X[n-1]_i}$'s.

Finally, we denote by $f_n : X[n] \rightarrow X^n$ the composition of these blow-ups.

Lemma 1.2. *The Picard number of $X[n]$ is given by $\rho(X[n]) = \rho(X^n) + 2^n - n - 1$ if $\dim(X) \geq 2$, and by $\rho(C[n]) = \rho(C^n) + 2^n - \frac{n}{2}(n+1) - 1$ if $X = C$ is a curve.*

Proof. It is enough to prove that $X[n]$ is obtained from X^n by a sequence of $2^n - n - 1$ blow-ups. This is clear for $n = 1$. We proceed by induction on n . By induction hypothesis $X[n-1] \times X$ is obtained from $X^n = X^{n-1} \times X$ via a sequence of $2^{n-1} - n$ blow-ups. To conclude it is enough to observe that by Construction 1.1 $X[n]$ is obtained from $X[n-1] \times X$ by a sequence of

$$\sum_{k=1}^{n-1} \binom{n-1}{k} = \sum_{k=0}^{n-1} \binom{n-1}{k} - 1 = 2^{n-1} - 1$$

blow-ups. If $X = C$ is a curve the last $\binom{n}{2}$ blow-ups are blow-ups of Cartier divisors, therefore they do not modify the variety, and in particular they do not contribute to the Picard number. \square

A symmetric construction of $X[n]$ has been realized by several authors [DP95], [Li09], [MP98]. In the following we give a simple proof of the fact that $X[n]$ may be constructed from $X[n]$ by a symmetric sequence of blow-ups.

Proposition 1.3. *Let us consider the following sequence of blow-ups:*

- $X[n]_1$ is the blow-up of $X[n]$ along $\Delta_{1,\dots,n}$;
- $X[n]_2$ is the blow-up of $X[n]_1$ along the strict transforms of the diagonals Δ_S with $|S| = n - 1$;
- \vdots
- $X[n]_i$ is the blow-up of $X[n]_{i-1}$ along the strict transforms of the diagonals Δ_S with $|S| = n - i + 1$;
- \vdots
- $X[n]_{n-1}$ is the blow-up of $X[n]_{n-2}$ along the strict transforms of the diagonals Δ_S with $|S| = 2$.

Let $g_n : X[n]_{n-1} \rightarrow X^n$ be the birational morphism given by the above sequence of blow-ups. Then $X[n]_{n-1}$ is a smooth variety isomorphic to $X[n]$.

Proof. In [FM94] the authors constructed $X[n]$ as a wonderful compactification by taking the closure of $\mathcal{C}(X, n)$ in the product

$$X^n \times \prod_{2 \leq |S| \leq n} Bl_{\Delta_S} X^S$$

where X^S denotes the Cartesian product with respect to $S \subseteq \{1, \dots, n\}$. Now, let $\Delta = \bigcup_{2 \leq |S| \leq n} \Delta_S \subset X^n$, and let \mathcal{I}_Δ be its ideal sheaf. By [Li09, Theorem 1.3] we have that

$$(1.1) \quad X[n] \cong Bl_{\mathcal{I}_\Delta} X^n$$

Since $g_n^{-1}(\Delta) \subset X[n]_{n-1}$ is a Cartier divisor in $X[n]_{n-1}$, by (1.1) and the universal property of the blow-up [Ha77, Proposition 7.14] there exists a unique morphism $\psi : X[n]_{n-1} \rightarrow X[n]$ such that the following diagram

$$\begin{array}{ccc} X[n]_{n-1} & \xrightarrow{\psi} & X[n] \\ & \searrow g_n & \downarrow f_n \\ & & X^n \end{array}$$

is commutative. Note that at any step of the blow-up construction in the statement we blow-up disjoint subvarieties. This is because their intersections have been blown-up in the previous step. Therefore, $X[n]_{n-1}$ is smooth and its Picard number is given by

$$\rho(X[n]_{n-1}) = \rho(X^n) + \sum_{k=2}^n \binom{n}{k} = \rho(X^n) + \sum_{k=0}^n \binom{n}{k} - n - 1 = \rho(X^n) + 2^n - n - 1$$

if $\dim(X) \geq 2$, and by

$$\rho(C[n]_{n-1}) = \rho(C^n) + \sum_{k=3}^n \binom{n}{k} = \rho(C^n) + 2^n - \frac{n}{2}(n+1) - 1$$

if $X = C$ is a curve. By Lemma 1.2 we get $\rho(X[n]_{n-1}) = \rho(X[n])$. Then the birational morphism ψ can not be a divisorial contraction. On the other hand by [FM94, Theorem 1] $X[n]$ is smooth, hence ψ can not be a small contraction either. We conclude that $\psi :$

$X[n]_{n-1} \rightarrow X[n]$ is a bijective morphism, and since $X[n]$ is smooth by Zariski's main theorem it is an isomorphism. \square

1.2. Kontsevich moduli spaces of stable maps to homogeneous varieties. An n -pointed rational quasi-stable curve $(C, (x_1, \dots, x_n))$ is a projective, connected, reduced rational curve with at most nodal singularities of arithmetic genus zero, with n distinct and smooth marked points $x_1, \dots, x_n \in C$. We will refer to the marked and the singular points of C as special points.

Let X be a homogeneous variety. A map $(C, (x_1, \dots, x_n), \alpha)$, where $\alpha : C \rightarrow X$ is a morphism from an n -pointed rational quasi-stable curve to X is stable if any component $E \cong \mathbb{P}^1$ of C contracted by α contains at least three special points.

Now, let us fix a class $\beta \in H_2(X, \mathbb{Z})$. By [FP97, Theorem 2] there exists a smooth, proper, and separated Deligne-Mumford stack $\overline{\mathcal{M}}_{0,n}(X, \beta)$ parametrizing isomorphism classes of stable maps $[C, (x_1, \dots, x_n), \alpha]$ such that $\alpha_*[C] = \beta$.

Furthermore, by [KP01, Corollary 1] the coarse moduli space $\overline{M}_{0,n}(X, \beta)$ associated to the stack $\overline{\mathcal{M}}_{0,n}(X, \beta)$ is a normal, irreducible, projective variety with at most finite quotient singularities of dimension

$$\dim(\overline{M}_{0,n}(X, \beta)) = \dim(X) + \int_{\beta} c_1(T_X) + n - 3$$

The variety $\overline{M}_{0,n}(X, \beta)$ is called the *moduli spaces of stable maps*, or the *Kontsevich moduli spaces* of stable maps of class β from a rational quasi-stable n -pointed curve to X . The boundary $\partial \overline{M}_{0,n}(X, \beta) = \overline{M}_{0,n}(X, \beta) \setminus M_{0,n}(X, \beta)$ is a simple normal crossing divisor in $\overline{M}_{0,n}(X, \beta)$, whose points parametrize isomorphism classes of stable maps $[C, (x_1, \dots, x_n), \alpha]$ where C is a reducible curve. When $X = \mathbb{P}^N$, we will write $\overline{M}_{0,n}(\mathbb{P}^N, d)$ for $\overline{M}_{0,n}(\mathbb{P}^N, d[L])$, where $L \subseteq \mathbb{P}^N$ is a line.

1.2.1. Natural morphisms. There are several natural morphisms defined on $\overline{M}_{0,n}(X, \beta)$. For any $i \in \{1, \dots, n\}$ we have the i -th *evaluation map*:

$$\begin{aligned} ev_i : \quad \overline{M}_{0,n}(X, \beta) &\longrightarrow X \\ [C, (x_1, \dots, x_n), \alpha] &\longmapsto \alpha(x_i) \end{aligned}$$

Furthermore, there are the *forgetful morphisms*

$$(1.2) \quad \pi_{i_1, \dots, i_k} : \overline{M}_{0,n}(X, \beta) \rightarrow \overline{M}_{0, n-k}(X, \beta)$$

forgetting the marked points x_{i_1}, \dots, x_{i_k} and stabilizing the resulting map, and if $n \geq 3$ we have the forgetful morphism

$$\rho : \overline{M}_{0,n}(X, \beta) \rightarrow \overline{M}_{0,n}$$

forgetting the map and stabilizing the domain curve.

Remark 1.4. If $d = N = 1$ the Kontsevich moduli space $\overline{M}_{0,n}(\mathbb{P}^1, 1)$ is isomorphic to the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$. By Section 1.2.1 we have a morphism

$$\begin{aligned} ev := ev_1 \times \dots \times ev_n : \quad \overline{M}_{0,n}(\mathbb{P}^1, 1) &\longrightarrow (\mathbb{P}^1)^n \\ [C, (x_1, \dots, x_n), \alpha] &\longmapsto (\alpha(x_1), \dots, \alpha(x_n)) \end{aligned}$$

For any $\{i_1, \dots, i_k\} \subset \{1, \dots, n\}$ with $k \geq 2$ let $D_{i_1, \dots, i_k} \subset \overline{M}_{0,n}(\mathbb{P}^1, 1)$ be the divisor whose general point corresponds to a stable map $[C, (x_1, \dots, x_n), \alpha]$, where $C = C_1 \cup C_2$ is the union of two smooth rational curves, C_1 has marked points x_{i_1}, \dots, x_{i_k} and is contracted to a point

via α , while C_2 is mapped isomorphically onto \mathbb{P}^1 by α . Then $ev(D_{i_1, \dots, i_k}) = \Delta_{i_1, \dots, i_k} \subset (\mathbb{P}^1)^n$, and ev is exactly the blow-up morphism $g_n : \mathbb{P}^1[n] \rightarrow (\mathbb{P}^1)^n$ in Proposition 1.3.

We will need the following simple result on the fibers of the evaluation maps.

Lemma 1.5. *Let X be a homogeneous variety. Then all the fibers of the evaluation map $ev_i : \overline{M}_{0,n}(X, \beta) \rightarrow X$ are isomorphic.*

Proof. Let $p, q \in X$ be two points, and let $F_p = ev_i^{-1}(p)$, $F_q = ev_i^{-1}(q)$ be the corresponding two fibers of ev_i . Let $\mu \in \text{Aut}^o(X)$ be an automorphism of X such that $\mu(p) = q$. Since μ is in the connected component of the identity of $\text{Aut}(X)$ it must preserve the class β , and

$$\begin{array}{ccc} f_\mu & F_p & \longrightarrow F_q \\ & [C, (x_1, \dots, x_n), \alpha] & \longmapsto [C, (x_1, \dots, x_n), \mu \circ \alpha] \end{array}$$

is an isomorphism whose inverse is $f_{\mu^{-1}}$. \square

1.2.2. Kapranov's blow-up construction of $\overline{M}_{0,n}$. We follow [Ka93]. Let (C, x_1, \dots, x_n) be a genus zero n -pointed stable curve. The dualizing sheaf ω_C of C is invertible, see [Kn83]. By [Kn83, Corollaries 1.10 and 1.11] the sheaf $\omega_C(x_1 + \dots + x_n)$ is very ample and has $n - 1$ independent sections. Then it defines an embedding $\phi : C \rightarrow \mathbb{P}^{n-2}$. In particular, if $C \cong \mathbb{P}^1$ then $\deg(\omega_C(x_1 + \dots + x_n)) = n - 2$, $\omega_C(x_1 + \dots + x_n) \cong \phi^* \mathcal{O}_{\mathbb{P}^{n-2}}(1) \cong \mathcal{O}_{\mathbb{P}^1}(n - 2)$, and $\phi(C)$ is a degree $n - 2$ rational normal curve in \mathbb{P}^{n-2} . By [Ka93, Lemma 1.4] if (C, x_1, \dots, x_n) is stable the points $p_i = \phi(x_i)$ are in linear general position in \mathbb{P}^{n-2} .

This fact combined with a careful analysis of limits in $\overline{M}_{0,n}$ of 1-parameter families in $M_{0,n}$ led M. Kapranov to prove the following theorem [Ka93, Theorem 0.1]:

Theorem 1.6. *Let $p_1, \dots, p_n \in \mathbb{P}^{n-2}$ be points in linear general position, and let $V_0(p_1, \dots, p_n)$ be the scheme parametrizing rational normal curves through p_1, \dots, p_n . Consider $V_0(p_1, \dots, p_n)$ as a subscheme of the Hilbert scheme \mathcal{H} parametrizing subschemes of \mathbb{P}^{n-2} . Then*

- $V_0(p_1, \dots, p_n) \cong M_{0,n}$.
- Let $V(p_1, \dots, p_n)$ be the closure of $V_0(p_1, \dots, p_n)$ in \mathcal{H} . Then $V(p_1, \dots, p_n) \cong \overline{M}_{0,n}$.

Kapranov's construction allows to translate many issues of $\overline{M}_{0,n}$ into statements on linear systems on \mathbb{P}^{n-3} . Consider a general line $L_i \subset \mathbb{P}^{n-2}$ through p_i . There is a unique rational normal curve C_{L_i} through p_1, \dots, p_n , and with tangent direction L_i in p_i . Let $[C, x_1, \dots, x_n] \in \overline{M}_{0,n}$ be a stable curve, and let $\Gamma \in V_0(p_1, \dots, p_n)$ be the corresponding curve. Since $p_i \in \Gamma$ is a smooth point considering the tangent line $T_{p_i}\Gamma$ we get a morphism

$$\begin{array}{ccc} f_i : & \overline{M}_{0,n} & \longrightarrow \mathbb{P}^{n-3} \\ & [C, x_1, \dots, x_n] & \longmapsto T_{p_i}\Gamma \end{array}$$

For any $i = 1, \dots, n$ the class Ψ_i is the line bundle on $\overline{M}_{0,n}$ whose fiber on $[C, x_1, \dots, x_n]$ is the tangent line $T_{p_i}C$. From the previous description we see that the line bundle Ψ_i induces the birational morphism $f_i : \overline{M}_{0,n} \rightarrow \mathbb{P}^{n-3}$, that is $\Psi_i = f_i^* \mathcal{O}_{\mathbb{P}^{n-3}}(1)$.

In [Ka93] Kapranov proved that Ψ_i is big and globally generated, and that the birational morphism f_i is an iterated blow-up of the projections from p_i of the points $p_1, \dots, \hat{p}_i, \dots, p_n$ and of all strict transforms of the linear spaces they generate, in order of increasing dimension.

Construction 1.7. [Has03, Section 6.2] Fixed $(n - 1)$ -points $p_1, \dots, p_{n-1} \in \mathbb{P}^{n-3}$ in linear general position:

- (1) blow-up the points p_1, \dots, p_{n-1} ;
- (2) blow-up the strict transforms of the lines $\langle p_{i_1}, p_{i_2} \rangle$, $i_1, i_2 = 1, \dots, n-1$;
- \vdots
- (k) blow-up the strict transforms of the $(k-1)$ -planes $\langle p_{i_1}, \dots, p_{i_k} \rangle$, $i_1, \dots, i_k = 1, \dots, n-1$;
- \vdots
- ($n-4$) blow-up the strict transforms of the $(n-5)$ -planes $\langle p_{i_1}, \dots, p_{i_{n-4}} \rangle$, $i_1, \dots, i_{n-4} = 1, \dots, n-1$.

Then the variety obtained at the step $n-4$ is isomorphic to $\overline{M}_{0,n}$

2. BASE POINT FREE PENCILS ON $\mathbb{P}^1[n]$

The main purpose of this section is to classify base point free pencils on the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$ of n points on \mathbb{P}^1 . Along both the present and the next section we will need the so called rigidity lemma.

Lemma 2.1. [KM98, Lemma 1.6] *Let X be an irreducible variety, $g : X \rightarrow Z$ a proper, surjective morphism with connected fibers, all of the same dimension, and $f : X \rightarrow Y$ a morphism. Assume that there exists a point $z_0 \in Z$ such that $f(g^{-1}(z_0))$ is a point. Then $f(g^{-1}(z))$ is a point for any $z \in Z$.*

We begin by describing fibrations of the Cartesian product of smooth curves of genus different from one.

Lemma 2.2. *Let $C_1, \dots, C_n, B_1, \dots, B_r$ be smooth projective curves with either $g(B_i) \geq 2$ for any $i = 1, \dots, r$ or $g(C_i) = 0$ for any $i = 1, \dots, n$, and let $\psi : C_1 \times \dots \times C_n \rightarrow B_1 \times \dots \times B_r$ be a dominant morphism. Then there exist $i_1, \dots, i_r \in \{1, \dots, n\}$, and morphisms $f_{i_j} : C_{i_j} \rightarrow B_{j_j}$ such that the following diagram*

$$\begin{array}{ccc}
 C_1 \times \dots \times C_n & & \\
 \pi_{i_1} \times \dots \times \pi_{i_r} \downarrow & \searrow \psi & \\
 C_{i_1} \times \dots \times C_{i_r} & \xrightarrow{f_{i_1} \times \dots \times f_{i_r}} & B_1 \times \dots \times B_r
 \end{array}$$

commutes, where $\pi_{i_j} : C_1 \times \dots \times C_n \rightarrow C_{i_j}$ is the i_j -th canonical projection. In particular, any dominant morphism $\phi : C^n \rightarrow C$ factors through one of the projections.

Proof. It is enough to prove that for any projection $p_i : B_1 \times \dots \times B_r \rightarrow B_i$ the morphism $p_i \circ \psi$ factors through some projection $\pi_{j_i} : C_1 \times \dots \times C_n \rightarrow C_{j_i}$.

Let us begin with the case $g(B_i) \geq 2$. If $n = 2$ this follows from [Ca00, Lemma 3.8]. We proceed by induction on n . Let us consider the first projection $\pi_1 : C_1 \times \dots \times C_n = C_1 \times (C_2 \times \dots \times C_n) \rightarrow C_1$. If $(p_i \circ \psi)|_{C_2 \times \dots \times C_n}$ is constant then by Lemma 2.1 $p_i \circ \psi$ factors through π_1 .

If $(p_i \circ \psi)|_{C_2 \times \dots \times C_n} : C_2 \times \dots \times C_n \rightarrow B_i$ is dominant then by induction hypothesis $(p_i \circ \psi)|_{C_2 \times \dots \times C_n}$ factors through a projection $C_2 \times \dots \times C_n \rightarrow C_{j_i}$. Note that such a projection is the restriction to $C_2 \times \dots \times C_n$ of the projection $\pi_{j_i} : C_1 \times \dots \times C_n \rightarrow C_{j_i}$. Therefore, $p_i \circ \psi$ contracts the fibers of π_{j_i} , and again by Lemma 2.1 we conclude that $p_i \circ \psi$ factors through π_{j_i} .

Furthermore, since any dominant morphism $\mathbb{P}^1 \times \mathbb{P}^1 \rightarrow \mathbb{P}^1$ factors through one of the projections the argument above extends to the case $g(C_i) = 0$. The second part of the statement follows by taking $C_1 \cong \dots \cong C_n \cong C$, $r = 1$ and $B_1 \cong C$. \square

Remark 2.3. Note that Lemma 2.2 does not hold for curves of genus one, or more generally for abelian varieties. Indeed, if A is an abelian variety the multiplication map $A \times A \rightarrow A$ does not factor through one of the projections.

For the rest of this section we will focus on dominant morphisms $\mathbb{P}^1[n] \rightarrow \mathbb{P}^1$. Recall that by Remark 1.4 we can identify $\mathbb{P}^1[n]$ with the Kontsevich moduli space $\overline{M}_{0,n}(\mathbb{P}^1, 1)$.

2.1. The Picard group of $\mathbb{P}^1[n]$. We summarize the results on the Picard group of $\overline{M}_{0,n}(\mathbb{P}^N, d)$ in [CHS09] for the particular case $\overline{M}_{0,n}(\mathbb{P}^1, 1) \cong \mathbb{P}^1[n]$. By [CHS09, Section 2.1] there is a morphism

$$f_p : \overline{M}_{0,n+1} \rightarrow \mathbb{P}^1[n]$$

defined as follows. Let us fix a point $p \in \mathbb{P}^1$. For any $[C, (x_1, \dots, x_{n+1})] \in \overline{M}_{0,n+1}$ we attach a \mathbb{P}^1 at x_{n+1} , and consider the morphism $\alpha : C \cup \mathbb{P}^1 \rightarrow \mathbb{P}^1$ that contracts C to $p \in \mathbb{P}^1$ and maps the added rational tail isomorphically to \mathbb{P}^1 .

Furthermore, for any $i = 1, \dots, n$ there is a morphism

$$g_i : \mathbb{P}^1 \rightarrow \mathbb{P}^1[n]$$

defined as follows. Let us fix an $(n-1)$ -pointed rational curve C . At a general point of C we attach a \mathbb{P}^1 with the marked point $x_i \in \mathbb{P}^1$. The domain of the stable map is $C \cup \mathbb{P}^1$, and the map $\alpha : C \cup \mathbb{P}^1 \rightarrow \mathbb{P}^1$ is the identity on \mathbb{P}^1 , and contracts C .

Varying the point $x_i \in \mathbb{P}^1$ we get the morphism $g_i : \mathbb{P}^1 \rightarrow \mathbb{P}^1[n]$. By [CHS09, Theorem 2.3] we have that the map

$$(2.1) \quad h := f_p^* \times g_1^* \times \dots \times g_n^* : \text{Pic}(\mathbb{P}^1[n]) \rightarrow \text{Pic}(\overline{M}_{0,n+1}) \times \text{Pic}(\mathbb{P}^1)^n$$

is an isomorphism. Furthermore the image via h of the ample, nef and eventually-free cone of $\mathbb{P}^1[n]$ is the product of the ample, nef and eventually-free cones respectively of $\overline{M}_{0,n+1}$ and of the \mathbb{P}^1 factors.

Notation 2.4. The map $h = f_p^* \times g_1^* \times \dots \times g_n^*$ in (2.1) defines an isomorphism between $\text{Pic}(\mathbb{P}^1[n])$ and $\text{Pic}(\overline{M}_{0,n+1}) \times \text{Pic}(\mathbb{P}^1)^n$. Therefore, we may write any divisor D in $\mathbb{P}^1[n]$ as $D \equiv D_{0,n+1} + a_1 H_1 + \dots + a_n H_n$, where $D_{0,n+1}$ is a divisor on $\overline{M}_{0,n+1}$, the H_i 's are generators of the factors $\text{Pic}(\mathbb{P}^1)$, and $a_i \in \mathbb{Z}$.

2.2. Modular linear pencils on $\overline{M}_{0,n}(\mathbb{P}^N, d)$. By Section 1.2.1 there are several natural morphisms from $\overline{M}_{0,n}(\mathbb{P}^N, d)$ onto \mathbb{P}^1 . We may consider the composition

$$(2.2) \quad \overline{M}_{0,n}(\mathbb{P}^N, d) \xrightarrow{\rho} \overline{M}_{0,n} \xrightarrow{\pi_{i_1, \dots, i_{n-4}}} \overline{M}_{0,4} \cong \mathbb{P}^1$$

where $\pi_{i_1, \dots, i_{n-4}} : \overline{M}_{0,n} \rightarrow \overline{M}_{0,4}$ is the morphism forgetting the points labeled by i_1, \dots, i_{n-4} . Furthermore, if $N = 1$ we have the evaluation maps

$$(2.3) \quad ev_i : \overline{M}_{0,n}(\mathbb{P}^1, d) \rightarrow \mathbb{P}^1$$

Finally, if $N = d = 1$ we have also the forgetful morphisms

$$\pi_{i_1, \dots, i_{n-1}} : \mathbb{P}^1[n] \cong \overline{M}_{0,n}(\mathbb{P}^1, 1) \rightarrow \mathbb{P}^1[1] \cong \overline{M}_{0,1}(\mathbb{P}^1, 1) \cong \mathbb{P}^1$$

forgetting the points labeled with i_1, \dots, i_{n-1} .

Remark 2.5. The map $ev_1 : \overline{M}_{0,1}(\mathbb{P}^1, 1) \rightarrow \mathbb{P}^1$ is an isomorphism, and the diagram

$$\begin{array}{ccc} \mathbb{P}^1[n] & & \\ \pi_{i_1, \dots, i_{n-1}} \downarrow & \searrow ev_j & \\ \overline{M}_{0,1}(\mathbb{P}^1, 1) \cong \mathbb{P}^1[1] & \xrightarrow{ev_1} & \mathbb{P}^1 \end{array}$$

is commutative, where $\{j\} = \{1, \dots, n\} \setminus \{i_1, \dots, i_{n-1}\}$. Therefore, for any $j \in \{i, \dots, n\}$ the morphisms ev_j and $\pi_{\{1, \dots, n\} \setminus \{j\}}$ are induced by the same base point free pencil on $\mathbb{P}^1[n]$.

Definition 2.6. A *modular base point free pencil* on $\overline{M}_{0,n}(\mathbb{P}^1, d)$ is a linear system associated either to a forgetful morphism $\pi_{i_1, \dots, i_{n-4}} \circ \rho$ of type (2.2) or to an evaluation morphism ev_i of type (2.3).

Now let us consider the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$. By Proposition 1.3 we have that $\mathbb{P}^1[1] \cong \mathbb{P}^1$, $\mathbb{P}^1[2] \cong \mathbb{P}^1 \times \mathbb{P}^1$, and $\mathbb{P}^1[3] \cong Bl_{\Delta_{1,2,3}}(\mathbb{P}^1)^3$, where $\Delta_{1,2,3} \subset (\mathbb{P}^1)^3$ is the small diagonal. This variety appears among the Fano 3-folds of Picard number four in [MM81]. For the convenience of the reader we give a proof of the following well-known fact.

Lemma 2.7. *The blow-up of $(\mathbb{P}^1)^3$ along the small diagonal $\Delta_{1,2,3} \subset (\mathbb{P}^1)^3$ is isomorphic to the blow-up of \mathbb{P}^3 along three skew lines L_1, L_2, L_3 .*

Proof. Let $\pi_i : \mathbb{P}^3 \dashrightarrow \mathbb{P}^1$ be the projection with center the line L_i , and let us consider the rational map

$$\begin{array}{ccc} \pi : \mathbb{P}^3 & \dashrightarrow & \mathbb{P}^1 \times \mathbb{P}^1 \times \mathbb{P}^1 \\ x & \mapsto & (\pi_1(x), \pi_2(x), \pi_3(x)) \end{array}$$

The locus contracted by π is the union of the lines in \mathbb{P}^3 intersecting the L_i 's, that is the unique quadric surface Q containing L_1, L_2, L_3 . Clearly $\pi(Q) = \Delta_{1,2,3}$.

Therefore, π induces a birational morphism $\tilde{\pi} : Bl_{L_1, L_2, L_3} \mathbb{P}^3 \rightarrow (\mathbb{P}^1)^3$, whose exceptional locus is the strict transform \tilde{Q} of Q , and such that $\tilde{\pi}(\tilde{Q}) = \Delta_{1,2,3}$. Now, the universal property of the blow-up [Ha77, Proposition 7.14] yields a birational morphism $\tilde{\pi} : Bl_{L_1, L_2, L_3} \mathbb{P}^3 \rightarrow Bl_{\Delta_{1,2,3}}(\mathbb{P}^1)^3$ mapping \tilde{Q} to the exceptional divisor over $\Delta_{1,2,3}$. Finally, since $Bl_{L_1, L_2, L_3} \mathbb{P}^3$ and $Bl_{\Delta_{1,2,3}}(\mathbb{P}^1)^3$ are smooth and have the same Picard number $\tilde{\pi}$ is an isomorphism. \square

Let us denote by $E_i \subset \mathbb{P}^1[3]$ the exceptional divisor over L_i , and by \tilde{H} the pull-back of a general hyperplane of \mathbb{P}^3 via the blow-up morphism. Then $E_i \cong \mathbb{P}^1 \times \mathbb{P}^1$. We will denote by R_i, σ_i the classes of the two rulings of E_i , where R_i is contracted by the blow-up map. Finally, let \tilde{L} be the pull-back of a general line in \mathbb{P}^3 .

By [DPU15, Theorem 4.1] the effective cone $\text{Eff}(\mathbb{P}^1[3])$ of $\mathbb{P}^1[3]$ is the polyhedral cone generated by the extremal rays $2\tilde{H} - E_1 - E_2 - E_3$, $H - E_i$ and E_i for $i = 1, 2, 3$. Our aim is to describe its Mori Cone.

Lemma 2.8. *The Mori cone $\text{NE}(\mathbb{P}^1[3])$ of $\mathbb{P}^1[3]$ is the polyhedral cone generated by $\tilde{L} - R_1 - R_2 - R_3$, R_i and σ_i for $i = 1, 2, 3$.*

Proof. Since $\mathbb{P}^1[3]$ is Fano we know that $\text{NE}(\mathbb{P}^1[3])$ is a finitely generated polyhedral cone. Clearly, the classes R_i, σ_i are extremal. Now, let $\tilde{C} \subset \mathbb{P}^1[3]$ be an irreducible curve. If $\tilde{C} \subset E_i$ we may write its class as a combination with non-negative coefficients of R_i and σ_i . Therefore, let us assume that $\tilde{C} \not\subset E_i$ for any $i = 1, 2, 3$. In this case \tilde{C} is the strict transform of an irreducible curve $C \subset \mathbb{P}^3$ of degree d and intersecting L_i with multiplicity m_i . In other words we may write

$$\tilde{C} \sim d\tilde{L} - m_1R_1 - m_2R_2 - m_3R_3$$

where \sim denotes numerical equivalence. Now, note that

$$\tilde{C} \sim d(\tilde{L} - R_1 - R_2 - R_3) + (d - m_1)R_1 + (d - m_2)R_2 + (d - m_3)R_3$$

To conclude it is enough to observe that $d - m_i \geq 0$ for any $i = 1, 2, 3$, otherwise by Bezout's theorem the line L_i would be an irreducible component of C . \square

The alternative description of $\mathbb{P}^1[3]$ in Lemma 2.7 is helpful in order to classify the base point free pencils on $\mathbb{P}^1[3]$.

Lemma 2.9. *Let $\psi : \mathbb{P}^1[3] \rightarrow \mathbb{P}^1$ be a dominant morphism. Then ψ factors through an evaluation map.*

Proof. By Lemma 2.7 we can identify $\mathbb{P}^1[3]$ with the blow-up of \mathbb{P}^3 along three skew lines L_1, L_2, L_3 . The statement follows easily from the description of $\text{NE}(\mathbb{P}^1[3])$ in Lemma 2.8. However, we will give an alternative easy and geometrical proof.

The morphism ψ induces a rational map $\tilde{\psi} : \mathbb{P}^3 \dashrightarrow \mathbb{P}^1$ whose indeterminacy locus is contained in $L_1 \cup L_2 \cup L_3$. Let $H \subset \mathbb{P}^3$ be a general plane. Then the restriction $\tilde{\psi}|_H : H \cong \mathbb{P}^2 \dashrightarrow \mathbb{P}^1$ is a rational map whose indeterminacy locus is a finite set S contained in $\{L_1 \cap H, L_2 \cap H, L_3 \cap H\}$, and inducing a morphism $\psi|_H : \text{Bl}_S H \rightarrow \mathbb{P}^1$.

If $S = \{p_1, p_2, p_3\}$, that is $\text{Bl}_S H$ is a del Pezzo surface of degree six, it is well known that $\tilde{\psi}|_H$ must factor through a linear projection from one of the p_i 's, see for instance [MaM15, Proposition 2.2]. A fortiori the same result holds if $|S| \in \{1, 2\}$.

Therefore, $\tilde{\psi}|_H$ factors through the projection from one of the p_i 's, and hence $\tilde{\psi}$ is constant on the fibers of the projection π_{L_i} from one of the L_i 's. Then $\tilde{\psi}$ factors through π_{L_i} . Via the isomorphism $\tilde{\pi} : \text{Bl}_{L_1, L_2, L_3} \mathbb{P}^3 \rightarrow \text{Bl}_{\Delta_{1,2,3}}(\mathbb{P}^1)^3$, this means that ψ factors through the lifting of one of the three projections $(\mathbb{P}^1)^3 \rightarrow \mathbb{P}^1$, that is an evaluation map. \square

Now, we are ready to prove the main result of this section on base point free pencils on the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$.

Proposition 2.10. *Let $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$ be a dominant morphism. Then ψ factors through a morphism associated to a modular base point free pencil.*

Proof. By Proposition 1.3 $\mathbb{P}^1[n]$ is the blow-up $g_n : \mathbb{P}^1[n] \rightarrow (\mathbb{P}^1)^n$ along the diagonals in order of increasing dimension. Now, let $b_1 : \mathbb{P}^1[n]_1 \rightarrow (\mathbb{P}^1)^n$ be the blow-up of the smallest diagonal $\Delta_{1,\dots,n}$, and fixed a point $p \in \Delta_{1,\dots,n}$ let us consider the fiber $b_1^{-1}(p) \cong \mathbb{P}^{n-2}$.

The strict transforms of the diagonals Δ_S with $|S| = n - r$, $r \in \{1, \dots, n - 3\}$ intersect $b_1^{-1}(p)$ in $\binom{n}{r}$ linear subspaces of dimension $r - 1$. Furthermore the linear subspaces determined by the diagonals Δ_S with $|S| = n - r$ intersect exactly in the linear subspaces cut out by the diagonals Δ_S with $|S| = n - r + 1$.

Therefore, if $b : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[n]_1$ is the blow-up of the strict transforms of the diagonals Δ_S with $2 \leq \dim(\Delta_S) \leq n - 2$, that is the birational morphism fitting in the following commutative diagram

$$\begin{array}{ccc} \mathbb{P}^1[n] & & \\ \downarrow g_n & \searrow b & \\ & \mathbb{P}^1[n]_1 & \\ & \swarrow b_1 & \\ (\mathbb{P}^1)^n & & \end{array}$$

we have that $b|_{g_n^{-1}(p)} : g_n^{-1}(p) \rightarrow b_1^{-1}(p) \cong \mathbb{P}^{n-2}$ is the blow-up morphism in Construction 1.7, and hence $g_n^{-1}(p) \cong \overline{M}_{0,n+1}$.

Note that the image of the morphism $f_p : \overline{M}_{0,n+1} \rightarrow \mathbb{P}^1[n]$ in Section 2.1 is the fiber $g_n^{-1}(p) \cong \overline{M}_{0,n+1}$. Let us assume that ϕ contracts $g_n^{-1}(p)$ for some $p \in \Delta_{1,\dots,n}$. Therefore, ψ contracts $g_n^{-1}(p)$ for any $p \in \Delta_{1,\dots,n}$ since the fibers $g_n^{-1}(p)$ are all numerically equivalent. Now, let $E_S = g_n^{-1}(\Delta_S)$ be the exceptional divisor over Δ_S , and $g_{n,S} : E_S \rightarrow \Delta_S$ be the restriction of g_n to E_S . For any $p \in \Delta_{1,\dots,n}$ we have $g_{n,S}^{-1}(p) \subset g_n^{-1}(p)$. Therefore, ψ contracts the fiber $g_{n,S}^{-1}(p)$.

Now, since $g_{n,S} : E_S \rightarrow \Delta_S$ is a morphism with connected fibers all of the same dimension Lemma 2.1 yields that ψ must contract all the fibers of $g_{n,S} : E_S \rightarrow \Delta_S$. We conclude that if ψ contracts a fiber $g_n^{-1}(p) \cong \overline{M}_{0,n+1}$ then it must contract all the fibers of any morphism $g_{n,S} : E_S \rightarrow \Delta_S$ with $|S| = n - r$, $r \in \{1, \dots, n - 3\}$, and hence ψ factors through the blow-up morphism $g_n : \mathbb{P}^1[n] \rightarrow (\mathbb{P}^1)^n$, that is there exists a commutative diagram as follows

$$\begin{array}{ccc} \mathbb{P}^1[n] & & \\ \downarrow g_n & \searrow \psi & \\ (\mathbb{P}^1)^n & \longrightarrow & \mathbb{P}^1 \end{array}$$

Since by Lemma 2.2 any morphism $(\mathbb{P}^1)^n \rightarrow \mathbb{P}^1$ factors through a projection onto one of the factors we get that ψ factors through an evaluation map.

Now, let us assume that ψ restricts to a dominant morphism on $g_n^{-1}(p) \cong \overline{M}_{0,n+1}$. Following Notation 2.4 let $D^\psi \equiv D_{0,n+1}^\psi + a_1^\psi H_1 + \dots + a_n^\psi H_n$ be the decomposition of the divisor D^ψ associated to the morphism $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$.

Note that by Section 2.1 the divisor H_i induces the evaluation map ev_i . In particular,

since any ev_i contracts the fiber $g_n^{-1}(p)$ we have that $a_i^\psi = 0$ for any $i = 1, \dots, n$, and $D^\psi \equiv D_{0,n+1}^\psi$.

By [BM13, Corollary 3.8] $\psi|_{\overline{M}_{0,n+1}}$ factors through a forgetful morphism $\pi_{i_1, \dots, i_{n-3}}$ and a finite morphism. Now, we distinguish two cases.

- Assume that $n+1 \in \{i_1, \dots, i_{n-3}\}$, say $n+1 = i_{n-3}$. In this case the morphism

$$\mathbb{P}^1[n] \cong \overline{M}_{0,n}(\mathbb{P}^1, 1) \xrightarrow{\rho} \overline{M}_{0,n} \xrightarrow{\pi_{i_1, \dots, i_{n-4}}} \overline{M}_{0,4} \cong \mathbb{P}^1$$

restricts to ψ on $\overline{M}_{0,n+1}$. Furthermore, since (2.1) is an isomorphism it is the only morphism with this property, and hence ψ factors through $\pi_{i_1, \dots, i_{n-4}} \circ \rho$.

- Now, assume that $n+1 \notin \{i_1, \dots, i_{n-3}\}$. In this case the forgetful morphism

$$\pi_{i_1, \dots, i_{n-3}} : \mathbb{P}^1[n] \cong \overline{M}_{0,n}(\mathbb{P}^1, 1) \rightarrow \mathbb{P}^1[3] \cong \overline{M}_{0,3}(\mathbb{P}^1, 1)$$

coincides with ψ on $\overline{M}_{0,n+1}$, and by (2.1) ψ must factor through $\pi_{i_1, \dots, i_{n-3}}$, that is $\psi = \xi \circ \pi_{i_1, \dots, i_{n-3}}$ where $\xi : \mathbb{P}^1[3] \rightarrow \mathbb{P}^1$ is a morphism. On the other hand, by Lemma 2.9 the morphism ξ factors through an evaluation morphism $ev_i : \mathbb{P}^1[3] \rightarrow \mathbb{P}^1$. Note that $(ev_i \circ \pi_{i_1, \dots, i_{n-3}} \circ \psi)(\overline{M}_{0,n+1})$ is a point for any i , and hence $(\xi \circ \pi_{i_1, \dots, i_{n-3}} \circ f)(\overline{M}_{0,n+1})$ is a point as well. A contradiction.

We conclude that ψ factors either through an evaluation map or a morphism of the type $\pi_{i_1, \dots, i_{n-4}} \circ \rho$ as in (2.2). \square

3. ON THE FIBRATIONS OF $X[n]$

Our next aim is to describe dominant morphisms $\mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$ with $r \geq 2$. The case $r = 2$ is an immediate consequence of Proposition 2.10.

Proposition 3.1. *Let $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[2]$ be a dominant morphism. Then ψ factors through a product of two morphisms associated to modular base point free pencils.*

Proof. Since $\mathbb{P}^1[2] \cong \mathbb{P}^1 \times \mathbb{P}^1$ the morphism ψ is completely determined by the two morphisms $\pi_i \circ \psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$, where the $\pi_i : \mathbb{P}^1[2] \rightarrow \mathbb{P}^1$ for $i = 1, 2$ are the projections onto the factors. Now, the statement follows immediately from Proposition 2.10. \square

When $r \geq 3$ the geometry of $\mathbb{P}^1[r]$ radically changes. This is because now inside $\mathbb{P}^1[r]$ there are negative divisors imposing several constraints on morphisms $\mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$. Indeed, the case $r = 3$ is the first one in which we really need to blow-up a codimension two subvariety of $(\mathbb{P}^1)^r$ to construct $\mathbb{P}^1[r]$. This will be the leading idea for the rest of this section.

Lemma 3.2. *Let $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[3]$ be a dominant morphism with connected fibers. Then for any $i \in \{1, 2, 3\}$ the morphism $ev_i \circ \psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$ factors through an evaluation morphism $ev_{j_i} : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$.*

Proof. The morphism $ev_i \circ \psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$ has connected fibers. Therefore, by Proposition 2.10 we know that $ev_i \circ \psi$ factors either through an evaluation morphism ev_{j_i} and an automorphism $\mu_i \in PGL(2)$, or through a morphism of the type $\pi_{i_1, \dots, i_{n-4}} \circ \rho$ in (2.2) and again an automorphism $\mu_i \in PGL(2)$. Let $\xi_i : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$ be the morphism, either of type (2.2)

or of type (2.3), factorizing $ev_i \circ \psi$. Note that $\mu := \mu_1 \times \mu_2 \times \mu_3$ is an automorphism of $(\mathbb{P}^1)^3$, and we have the following commutative diagram

$$\begin{array}{ccc} \mathbb{P}^1[n] & \xrightarrow{\psi} & \mathbb{P}^1[3] \\ \xi_1 \times \xi_2 \times \xi_3 \downarrow & & \downarrow ev_1 \times ev_2 \times ev_3 \\ (\mathbb{P}^1)^3 & \xrightarrow{\mu} & (\mathbb{P}^1)^3 \end{array}$$

Recall that by Remark 1.4 the morphism $ev_1 \times ev_2 \times ev_3$ is nothing but the blow-up morphism $\mathbb{P}^1[3] \rightarrow (\mathbb{P}^1)^3$, that is the blow-up of the diagonal $\Delta_{1,2,3}$.

Now, let $x \in \Delta_{1,2,3} \subset (\mathbb{P}^1)^3$ be a point, and let F_x be the fiber of $ev_1 \times ev_2 \times ev_3$ over x . Then $\dim(F_x) = 1$, and if \overline{F}_x is a component of $\psi^{-1}(F_x)$ we have $\dim(\overline{F}_x) \geq n - 3 + 1 = n - 2$. On the other hand, \overline{F}_x is contracted to the point $y = \mu^{-1}(x)$ by $\xi_1 \times \xi_2 \times \xi_3$. Now, since ξ_i is either of type (2.2) or of type (2.3), $\overline{F}_x \subseteq (\xi_1 \times \xi_2 \times \xi_3)^{-1}(y)$, and $\dim(\overline{F}_x) \geq n - 2$ yield $y \in \Delta_{1,2,3}$.

Hence $\mu \in \text{Aut}((\mathbb{P}^1)^3)$ preserves $\Delta_{1,2,3}$. For instance, let us assume $\xi_1 = ev_1$, $\xi_2 = ev_2$ and $\xi_3 = \pi_I \circ \rho$, and let $(p, q, t) \in (\mathbb{P}^1)^3$ be a point. The other cases can be worked out with similar arguments. If $p \neq q$ then a general point in $(\xi_1 \times \xi_2 \times \xi_3)(p, q, t)$ is a stable map of the form $[C, (\alpha^{-1}(p), \alpha^{-1}(q), x_3, \dots, x_n), \alpha]$ such that $\xi_3([C, (\alpha^{-1}(p), \alpha^{-1}(q), x_3, \dots, x_n), \alpha]) = t$. Therefore, for any set I of $n - 4$ indices, in the notation above, we have $\dim(\overline{F}_x) \geq n - 3$. This yields $p = q$, and hence a general point in $(\xi_1 \times \xi_2 \times \xi_3)(p, q, t)$ is a stable map of the form $[C_1 \cup C_2, (x_1, \dots, x_n), \alpha]$ where $x_1, x_2 \in C_1$, α has degree zero on C_1 and one on C_2 , such that $\xi_3([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) = t$.

Now, $\dim(\overline{F}_x) = n - 2$ if and only if $\{1, \dots, n\} \setminus I = \{1, 2, i_3, i_4\}$ with $x_{i_3}, x_{i_4} \in C_2$. Furthermore, in this case $\xi_3([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) \in \overline{M}_{0,4}$ is the stable curve $[C_1 \cup C_2, (x_1, x_2, x_{i_3}, x_{i_4})]$ which corresponds to the point of $\overline{M}_{0,4} \cong \mathbb{P}^1$ representing a 4-pointed stable curve where x_1 and x_2 collide. Therefore $(p, q, t) \in \Delta_{1,2,3}$.

Now, let $E \subset \mathbb{P}^1[3]$ be the exceptional divisor on $\Delta_{1,2,3}$. Since $\mathbb{P}^1[3]$ is smooth any component of $D = \phi^{-1}(E) \subset \mathbb{P}^1[n]$ has codimension one. Furthermore $((\mu_1 \circ \xi_1) \times (\mu_2 \circ \xi_2) \times (\mu_3 \circ \xi_3))(D) = \Delta_{1,2,3}$. In particular, since $\mu^{-1}(\Delta_{1,2,3}) = \Delta_{1,2,3}$, any component of $(\xi_1 \times \xi_2 \times \xi_3)^{-1}(\Delta_{1,2,3})$ must have codimension one in $\mathbb{P}^1[n]$.

For instance, if the ξ_i 's are all evaluation maps, say ev_1, ev_2, ev_3 then the irreducible components of $(\xi_1 \times \xi_2 \times \xi_3)^{-1}(\Delta_{1,2,3})$ are the divisors $D_{1,2,3,i_1,\dots,i_k}$ with $0 \leq k \leq n - 3$, where a general point of $D_{1,2,3,i_1,\dots,i_k}$ corresponds to a stable map $[C_1 \cup C_2, (x_1, \dots, x_n), \alpha]$ with $x_1, x_2, x_3, x_{i_2}, \dots, x_{i_k} \in C_1$, the remaining marked points are in C_2 , and α has degree zero and one on C_1 and C_2 respectively.

Now let us assume that ξ_1 is a morphism of type (2.2), say $\pi_{i_1,\dots,i_{n-4}} \circ \rho$, while ξ_2, ξ_3 are the evaluation maps ev_1, ev_2 . A general point in the exceptional divisor $E_{1,\dots,n} \subset \mathbb{P}^1[n]$ over the diagonal $\Delta_{1,\dots,n} \subset (\mathbb{P}^1)^n$ represents a stable map $[C_1 \cup C_2, (x_1, \dots, x_n), \alpha]$, where $x_1, \dots, x_n \in C_1$, and α has degree zero and one on C_1 and C_2 respectively.

Clearly $ev_1([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) = ev_2([C_1 \cup C_2, (x_1, \dots, x_n), \alpha])$. Now, the condition $(\pi_{i_1,\dots,i_{n-4}} \circ \rho)([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) = [C_2, (x_{i_1}, \dots, x_{i_4})] = \alpha(x_1) = \alpha(x_2)$ cuts out a codimension two component $L_1 \subset E_{1,\dots,n}$ of $((\pi_{i_1,\dots,i_{n-4}} \circ \rho) \times ev_1 \times ev_2)^{-1}(\Delta_{1,2,3})$. A contradiction.

Now, let us consider the case $\xi_1 = \pi_{i_1,\dots,i_{n-4}} \circ \rho$, $\xi_2 = \pi_{j_1,\dots,j_{n-4}} \circ \rho$, and $\xi_3 = ev_1$. Consider the divisor whose general point corresponds to a stable map $[C_1 \cup C_2, (x_1, \dots, x_n), \alpha]$, where

$x_1, x_{i_1}, x_{i_2}, x_{j_1}, x_{j_2} \in C_1$, $x_{i_3}, x_{i_4}, x_{j_3}, x_{j_4} \in C_2$, and α has degree one on C_1 and zero on C_2 . Clearly, $(\pi_{i_1, \dots, i_{n-4}} \circ \rho)([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) = (\pi_{j_1, \dots, j_{n-4}} \circ \rho)([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) = [C_1 \cap C_2, (x_{i_1}, \dots, x_{i_4})]$. On the other hand, since $x_1 \in C_1$ and α does not contract C_1 the condition $ev_1([C_1 \cup C_2, (x_1, \dots, x_n), \alpha]) = [C_1 \cup C_2, (x_{i_1}, \dots, x_{i_4})]$ defines a codimension two locus $L_2 \subset \mathbb{P}^1[n]$ which is a component of $((\pi_{i_1, \dots, i_{n-4}} \circ \rho) \times (\pi_{j_1, \dots, j_{n-4}} \circ \rho) \times ev_2)^{-1}(\Delta_{1,2,3})$. A contradiction.

Finally, we consider the case $\xi_1 = \pi_{i_1, \dots, i_{n-4}} \circ \rho$, $\xi_2 = \pi_{j_1, \dots, j_{n-4}} \circ \rho$, and $\xi_3 = \pi_{k_1, \dots, k_{n-4}} \circ \rho$. The sets $I = \{i_1, \dots, i_4\}$, $J = \{j_1, \dots, j_4\}$, $K = \{k_1, \dots, k_4\}$ differ by at least one element, say $i_4 \notin J \cup K$, $j_4 \notin I \cup K$, $k_4 \notin I \cup J$. In this case the codimension two locus $L_3 \subset \mathbb{P}^1[n]$ whose general point corresponds to a curve $[C_1 \cup C_2 \cup C_3, (x_1, \dots, x_n), \alpha]$, where $x_{i_4} \in C_2$, $x_{j_4}, x_{k_4} \in C_3$ and the remaining marked points are in C_1 is a component of $((\pi_{i_1, \dots, i_{n-4}} \circ \rho) \times (\pi_{j_1, \dots, j_{n-4}} \circ \rho) \times (\pi_{k_1, \dots, k_{n-4}} \circ \rho))^{-1}(\Delta_{1,2,3})$ of codimension two. Again a contradiction. \square

In order to prove our main result, given two forgetful morphisms π_I, π_J , we need to control the dimension of the intersection of two general fibers of π_I and π_J .

Lemma 3.3. *Fix a general point $x \in \mathbb{P}^1[n]$. Let $\pi_I : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r-1]$, $\pi_J : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r-1]$ be two forgetful morphisms, and $F_{I,x}, F_{J,x}$ be the fibers through x of π_I and π_J respectively. If $\dim(F_{I,x} \cap F_{J,x}) \geq n-r$ then $|I \cap J| \geq n-r$.*

Proof. Let $|I \cap J| = n-r-k$. We may assume $I = \{1, \dots, n-r-k, n-r-k+1, \dots, n-r+1\}$ and $J = \{1, \dots, n-r-k, n-r+2, \dots, n-r+k+2\}$.

A point $y \in F_{I,x} \cap F_{J,x}$ represents a pointed stable map where all the marked points but x_1, \dots, x_{n-r-k} are fixed, that is $F_{I,x} \cap F_{J,x}$ parametrizes configurations of $n-r-k$ points in \mathbb{P}^1 , and $\dim(F_{I,x} \cap F_{J,x}) = n-r-k$. Now, $\dim(F_{I,x} \cap F_{J,x}) = n-r-k \geq n-r$ yields $k \leq 0$. \square

Now, we are ready to prove the main result of this section on the classification of morphisms $\mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$.

Theorem 3.4. *Let $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$ be a dominant morphism with connected fibers. If $r \geq 3$ then ψ factors through a forgetful morphism $\pi_I : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$.*

Proof. Let us begin with the case $n = 3$. Keeping in mind that by Remark 2.5 we may identify evaluation maps $ev_i : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1$ with forgetful morphisms forgetting $n-1$ marked points, by Lemma 3.2 we get the following commutative diagram

$$\begin{array}{ccc} \mathbb{P}^1[n] & \xrightarrow{\psi} & \mathbb{P}^1[3] \\ & \searrow \mu \circ (\pi_I \times \pi_J \times \pi_K) & \downarrow ev_1 \times ev_2 \times ev_3 \\ & & (\mathbb{P}^1)^3 \end{array}$$

where μ is an automorphism of $(\mathbb{P}^1)^3$ preserving the diagonal $\Delta_{1,2,3}$, and we may assume $I = \{2, \dots, n\}$, $J = \{1, 3, \dots, n\}$, $K = \{1, 2, 4, \dots, n\}$. Since μ preserves the diagonal it lifts to an automorphism $\bar{\mu} : \mathbb{P}^1[3] \rightarrow \mathbb{P}^1[3]$. Therefore, the morphism $\bar{\mu} \circ \pi_{4, \dots, n} : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[3]$ and the morphism ψ coincide on a dense open subset of $\mathbb{P}^1[n]$, and hence they are the same morphism. This means that $\psi = \bar{\mu} \circ \pi_{4, \dots, n}$.

Now, we proceed by induction on $r \geq 4$. Let us consider two different forgetful morphisms

$\pi_i, \pi_j : \mathbb{P}^1[r] \rightarrow \mathbb{P}^1[r-1]$. Since $r-1 \geq 3$ by induction hypothesis we have the following diagram

$$\begin{array}{ccccc}
 & & \mathbb{P}^1[r-1] & \longrightarrow & \mathbb{P}^1[r-1] \\
 & \nearrow \pi_I & & & \nearrow \pi_i \\
 \mathbb{P}^1[n] & \xrightarrow{\psi} & \mathbb{P}^1[r] & & \\
 & \searrow \pi_J & & & \searrow \pi_j \\
 & & \mathbb{P}^1[r-1] & \longrightarrow & \mathbb{P}^1[r-1]
 \end{array}$$

In the notation of Lemma 3.3 let $x \in \mathbb{P}^1[n]$ be a general point, and $F_{I,x}, F_{J,x}$ be the fibers of π_I, π_J through x . Note that the fiber $F_{\psi,x}$ of ψ through x is contained in the intersection $F_{I,x} \cap F_{J,x}$. Therefore, Lemma 3.3 yields that π_I and π_J forget $n-r$ common marked points. If $\pi_{I \cap J} : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r]$ is the morphism forgetting these $n-r$ common points we have

$$F_{\psi,x} \subseteq F_{I,x} \cap F_{J,x} = F_{I \cap J,x}$$

Since $\dim(F_{\psi,x}) = n-r = \dim(F_{I \cap J,x})$ we get $F_{x,\psi} = F_{I \cap J,x}$. This means that ψ contracts to a point the general fiber of $\pi_{I \cap J}$. Finally, since $\pi_{I \cap J}$ is a morphism with connected fibers all of the same dimension, Lemma 2.1 yields that ψ contracts to a point all the fibers of $\pi_{I \cap J}$. This means that given a point $y \in \mathbb{P}^1[r]$ we have that $z = \psi(\pi_{I \cap J}^{-1}(y))$ is a point as well, and we get the commutative diagram

$$\begin{array}{ccc}
 \mathbb{P}^1[n] & & \\
 \pi_{I \cap J} \downarrow & \searrow \psi & \\
 \mathbb{P}^1[r] & \xrightarrow{\nu} & \mathbb{P}^1[r]
 \end{array}$$

where $\nu : \mathbb{P}^1[r] \rightarrow \mathbb{P}^1[r]$ is defined by $\nu(y) = z$. □

A small improvement is at hand.

Corollary 3.5. *Let $\psi : \mathbb{P}^1[n] \rightarrow \mathbb{P}^1[r_1] \times \dots \times \mathbb{P}^1[r_k]$ be a dominant morphism with connected fibers. Then ψ factors through a product of forgetful morphisms of type π_I (1.2) and $\rho \circ \pi_J$ (2.2). Furthermore, if $r_i \geq 3$ for any $i = 1, \dots, k$ then ψ factors through a product of forgetful morphisms of type π_I (1.2) only.*

Proof. It is enough to compose ψ with projections onto the factors, and to apply Propositions 2.10, 3.1, and Theorem 3.4. □

Finally, we extend the main results in Sections 2 and 3 for varieties not containing rational curves.

Lemma 3.6. *Let X be a smooth projective variety not containing any rational curve, and $\psi : X[n] \rightarrow X^r$ be a dominant morphism. Then ψ factors through the blow-up morphism $g_n : X[n] \rightarrow X^n$.*

Proof. It is enough to prove the claim in the case $r = 1$. If $r \geq 2$ we just consider the composition of ψ with the projections $X^r \rightarrow X$.

So, let $\psi : X[n] \rightarrow X^r$ be a dominant morphism, $x \in X^n$ a point, and $F_x = g_n^{-1}(x)$. Then F_x is a rational variety. Assume that F_x has positive dimension and that ψ does not contract F_x to a point in X . Then $\psi(F_x) \subseteq X$ is a rationally connected variety of positive

dimension. A contradiction, since by hypothesis X does contain rational curves. Therefore, ψ must contract any fiber of g_n . \square

It is straightforward to prove an analogue of Corollary 3.5 for $C[n]$ where C is a smooth projective curve with $g(C) \geq 2$. We will denote by $\pi_I : C[n] \rightarrow C[r]$ the forgetful morphisms. These are just the liftings of the projections $C^n \rightarrow C^r$.

Proposition 3.7. *Let C be a smooth projective curve of genus $g(C) \geq 2$, and $\psi : C[n] \rightarrow C[r_1] \times \dots \times C[r_k]$ be a dominant morphism with connected fibers. Then ψ factors through a product of forgetful morphisms.*

Proof. First let us consider a morphism $\psi : C[n] \rightarrow C[r]$. Let $g_r : C[r] \rightarrow C^r$ be the blow-up, and let us consider the composition $g_r \circ \psi : C[n] \rightarrow C^r$. By Lemma 3.6 we have the following commutative diagram:

$$\begin{array}{ccc} C[n] & \xrightarrow{\psi} & C[r] \\ g_n \downarrow & \bar{\psi} & \downarrow g_r \\ C^n & \xrightarrow{\quad} & C^r \end{array}$$

where $\bar{\psi} : C^n \rightarrow C^r$ is a dominant morphism with connected fibers. By Lemma 2.2 $\bar{\psi}$ must factor through a product of r of the projections onto the factors, and therefore ψ must factor through a forgetful morphism.

Finally, to get the result for dominant morphisms $C[n] \rightarrow C[r_1] \times \dots \times C[r_k]$ with connected fibers it is enough to compose ψ with projections onto the factor as in Corollary 3.5. \square

4. ON THE AUTOMORPHISMS OF $X[n]$ AND $\overline{M}_{0,n}(\mathbb{P}^N, d)$

In this section, taking advantage of the results on the fibrations in Sections 2 and 3, we study the automorphisms of the the Fulton-MacPherson compactification $X[n]$, and of the Kontsevich moduli space $\overline{M}_{0,n}(\mathbb{P}^N, d)$ in some significant cases.

4.1. Groups naturally acting on $\overline{M}_{0,n}(X, \beta)$. Let X be a homogeneous variety. The symmetric group S_n , and the connected component of the identity $\text{Aut}^o(X)$ of $\text{Aut}(X)$ act naturally on $\overline{M}_{0,n}(X, \beta)$ by

$$(4.1) \quad \begin{array}{ccc} S_n \times \overline{M}_{0,n}(X, \beta) & \longrightarrow & \overline{M}_{0,n}(X, \beta) \\ (\sigma, [C, (x_1, \dots, x_n), \alpha]) & \longmapsto & [C, (x_{\sigma(1)}, \dots, x_{\sigma(n)}), \alpha] \end{array}$$

and

$$(4.2) \quad \begin{array}{ccc} \text{Aut}^o(X) \times \overline{M}_{0,n}(X, \beta) & \longrightarrow & \overline{M}_{0,n}(X, \beta) \\ (\mu, [C, (x_1, \dots, x_n), \alpha]) & \longmapsto & [C, (x_1, \dots, x_1), \mu \circ \alpha] \end{array}$$

These two groups induce automorphisms of $\overline{M}_{0,n}(X, \beta)$, and the two actions commute, that is $S_n \times \text{Aut}^o(X) \subseteq \text{Aut}(\overline{M}_{0,n}(X, \beta))$. For instance, we have the following simple result.

Proposition 4.1. *The automorphisms of $\overline{M}_{0,0}(\mathbb{P}^2, 2)$ are exactly the ones induced by automorphisms of \mathbb{P}^2 , that is*

$$\text{Aut}(\overline{M}_{0,0}(\mathbb{P}^2, 2)) \cong \text{PGL}(3)$$

Proof. It is well known that the space $\overline{M}_{0,0}(\mathbb{P}^2, 2)$ is isomorphic to the space of complete conics, that is the blow-up of \mathbb{P}^5 along the Veronese surface $V \subset \mathbb{P}^5$ parametrizing double lines [FP97, Section 0.4]. Then by [Ha77, Corollary 7.15] the automorphism group of $\overline{M}_{0,0}(\mathbb{P}^2, 2)$ is isomorphic to the subgroup $\text{Aut}_V(\mathbb{P}^5) \subset PGL(6)$ of automorphisms of \mathbb{P}^5 stabilizing $V \cong \mathbb{P}^2$. To conclude it is enough to observe that $\text{Aut}_V(\mathbb{P}^5) \cong PGL(3)$. \square

Now, our aim is to study the connected component of the identity of $\text{Aut}(X[n])$ and $\text{Aut}(\overline{M}_{0,n}(X, \beta))$. The central ingredient of our argument will be the following scheme-theoretic version of Blanchard's theorem [Bl56, Section I.1] due to M. Brion.

Theorem 4.2. [Br11, Proposition 2.1] *Let G be a connected group scheme, X a scheme with an action of G , and $f : X \rightarrow Y$ a proper morphism such that $f_*\mathcal{O}_X \cong \mathcal{O}_Y$. Then there is a unique action of G on Y such that f is equivariant.*

We recall the following well-known fact.

Remark 4.3. If $\phi : X \rightarrow X$ is an automorphism of any scheme then the fixed locus of ϕ forms a closed subscheme. So once the fixed locus includes a dense set $\mathcal{U} \subset X$, the fixed locus is the entire space, and ϕ is the identity.

In order to use inductive arguments we will need the following result.

Lemma 4.4. *Let X be a homogeneous variety. If $\text{Aut}^o(\overline{M}_{0,n}(X, \beta)) \cong \text{Aut}^o(X)$ for an $n \geq 5$ then $\text{Aut}^o(\overline{M}_{0,k}(X, \beta)) \cong \text{Aut}^o(X)$ for any $k \geq n$.*

Proof. Let $\phi \in \text{Aut}^o(\overline{M}_{0,k+1}(X, \beta))$, with $k \geq n$, be an automorphism. We proceed by induction on k . By Theorem 4.2 with $f = \pi_i$ for $i = 1, \dots, k+1$, we get the following $k+1$

$$\begin{array}{ccccc} \overline{M}_{0,k+1}(X, \beta) & \xrightarrow{\phi} & \overline{M}_{0,k+1}(X, \beta) & & \overline{M}_{0,k+1}(X, \beta) \xrightarrow{\phi} \overline{M}_{0,k+1}(X, \beta) \\ \pi_1 \downarrow & & \downarrow \pi_1 & & \pi_{k+1} \downarrow & & \downarrow \pi_{k+1} \\ \overline{M}_{0,k}(X, \beta) & \xrightarrow{\overline{\phi}_1} & \overline{M}_{0,k}(X, \beta) & \dots & \overline{M}_{0,k}(X, \beta) \xrightarrow{\overline{\phi}_{k+1}} & \overline{M}_{0,k}(X, \beta) \end{array}$$

commutative diagrams, where $\overline{\phi}_i \in \text{Aut}^o(\overline{M}_{0,k}(X, \beta))$ for any $i = 1, \dots, k+1$. Therefore, by induction hypothesis $\overline{\phi}_i$ is given by

$$\begin{array}{ccc} \overline{\phi}_i : \overline{M}_{0,k}(X, \beta) & \longrightarrow & \overline{M}_{0,k}(X, \beta) \\ [C, (x_1, \dots, \hat{x}_i, \dots, x_{k+1}), \alpha] & \longmapsto & [C, (x_1, \dots, \hat{x}_i, \dots, x_{k+1}), \mu_i \circ \alpha] \end{array}$$

with $\mu_i \in \text{Aut}^o(X)$, for any $i = 1, \dots, k+1$. Now, let $[C, (x_1, \dots, x_{k+1}), \alpha] \in \overline{M}_{0,k+1}(X, \beta)$ be a general point, and let $[\Gamma, (y_1, \dots, y_{k+1}), \gamma] = \phi([C, (x_1, \dots, x_{k+1}), \alpha])$ be its image.

Since $\pi_i \circ \phi = \overline{\phi}_i \circ \pi_i$ we get $[C, (x_1, \dots, \hat{x}_i, \dots, x_{k+1}), \mu_i \circ \alpha] = [\Gamma, (y_1, \dots, \hat{y}_i, \dots, y_{k+1}), \gamma]$. Therefore, for any $i = 1, \dots, k+1$ we have an isomorphism $\tau_i : C \rightarrow \Gamma$ such that $\tau_i(x_j) = y_j$ for any $j \neq i$ and $\gamma \circ \tau_i = \mu_i \circ \alpha$.

Now, C and Γ are two smooth rational curves and since $k \geq n \geq 5$ the isomorphisms $\tau_i, \tau_j : C \rightarrow \Gamma$ coincide on at least three marked points x_h with $h \neq i, j$. Therefore, $\tau_1 = \tau_2 = \dots = \tau_{k+1}$ and $\mu_1 \circ \alpha = \mu_2 \circ \alpha = \dots = \mu_{k+1} \circ \alpha$. Since X is homogeneous this yields $\mu_1 = \mu_2 = \dots = \mu_{k+1}$. Let us denote this automorphism of X by μ , and consider the morphism of groups:

$$\begin{array}{ccc} \chi : \text{Aut}^o(\overline{M}_{0,k+1}(X, \beta)) & \longrightarrow & \text{Aut}^o(X) \\ & \xlongequal{\phi} & \mu \end{array}$$

By Section 4.1 χ is surjective. Now, assume that $\mu = \chi(\phi) = Id_X$. Then $\bar{\phi}_i = Id_{\overline{M}_{0,k}(X,\beta)}$ for any $i = 1, \dots, k+1$. Since $\bar{\phi}_1 = Id_{\overline{M}_{0,k}(X,\beta)}$ the automorphism ϕ restricts to an automorphism of the fiber $F_1 := \pi_1^{-1}([C, (x_2, \dots, x_{k+1}), \alpha]) \cong C$. Note that when x_1 collides with x_2, \dots, x_{k+1} we get k special points $\bar{x}_i \in F_1$ for $i = 2, \dots, k+1$, where $\bar{x}_i \in F_1$ corresponds to a stable map $[C \cup \mathbb{P}^1, (x_1, \dots, x_{k+1}), \alpha]$ with reducible domain, where $x_1, x_i \in \mathbb{P}^1$, and α contracts \mathbb{P}^1 . Now, since $\pi_i \circ \phi = \pi_i$ for $i = 2, \dots, k+1$ the automorphism $\pi|_{F_1} : F_1 \rightarrow F_1$ must fix $\bar{x}_i \in F_1$ for any $i = 2, \dots, k+1$. Since $k \geq 5$ this yields that $\phi|_{F_1} = Id_{F_1}$. Therefore, ϕ restricts to the identity on the general fiber of π_1 . Finally, to conclude that $\phi = Id_{\overline{M}_{0,k+1}(X,\beta)}$ it is enough to recall Remark 4.3. \square

4.1.1. Automorphisms of Cartesian products. We will need the following simple results on the automorphisms of Cartesian products.

Lemma 4.5. *Let X_1, \dots, X_n be complete varieties. Then $\text{Aut}^o(X_1 \times \dots \times X_n) \cong \text{Aut}^o(X_1) \times \dots \times \text{Aut}^o(X_n)$.*

Proof. The statement is trivial for $n = 1$. Let $Y = X_2 \times \dots \times X_n$, then by [Br11, Corollary 2.3] we have

$$\text{Aut}^o(X_1 \times \dots \times X_n) = \text{Aut}^o(X_1 \times Y) \cong \text{Aut}^o(X_1) \times \text{Aut}^o(Y)$$

To conclude it is enough to argue by induction on n . \square

Furthermore, by Lemma 2.2 it is straightforward to compute the automorphism group of a Cartesian product of curves of genus different from one.

Lemma 4.6. *Let C_1, \dots, C_r be smooth projective curves of genus $g(C_i) \neq 1$, and let us denote by $[C_{r_1}], \dots, [C_{r_k}]$ the isomorphism classes of curves in $\{C_1, \dots, C_r\}$, where r_i is the number of curves of class $[C_{r_i}]$. Then*

$$\text{Aut}(C_1 \times \dots \times C_r) \cong (S_{r_1} \ltimes \text{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \ltimes \text{Aut}(C_{r_k})^{r_k}).$$

In particular, $\text{Aut}(C^r) \cong S_r \ltimes \text{Aut}(C)^r$.

Proof. Let us fix an automorphism $\phi \in \text{Aut}(C_1 \times \dots \times C_r)$. We may assume that the curves of class $[C_{r_1}]$ are C_1, \dots, C_{r_1} . Let $\pi_i : C_1 \times \dots \times C_r \rightarrow C_1 \times \dots \times \widehat{C}_i \times \dots \times C_r$ be the projection forgetting the point on C_i .

By Lemma 2.2 for any $i \in \{1, \dots, r\}$ the morphism $\pi_i \circ \phi^{-1} : C_1 \times \dots \times C_r \rightarrow C_1 \times \dots \times \widehat{C}_i \times \dots \times C_r$ factors through a projection π_{j_i} , and hence we have the commutative diagram

$$\begin{array}{ccc} C_1 \times \dots \times C_r & \xrightarrow{\phi^{-1}} & C_1 \times \dots \times C_r \\ \pi_{j_i} \downarrow & & \downarrow \pi_i \\ C_1 \times \dots \times \widehat{C}_{j_i} \times \dots \times C_r & \xrightarrow{\bar{\phi}} & C_1 \times \dots \times \widehat{C}_i \times \dots \times C_r \end{array}$$

Note that ϕ^{-1} induces an isomorphism between the fiber of π_i which is C_i , and the fiber of π_{j_i} which is C_{j_i} . Therefore, $i \in \{1, \dots, r_1\}$ forces $j_i \in \{1, \dots, r_1\}$ as well, and we get a surjective morphism of groups

$$\begin{array}{ccc} \chi : \text{Aut}(C_1 \times \dots \times C_r) & \longrightarrow & S_{r_1} \\ \phi & \longmapsto & \sigma_\phi \end{array}$$

where $\sigma_\phi(i) = j_i$. Now, if ϕ induces the trivial permutation via χ then $\phi \in \text{Aut}(C_{r_1})^{r_1} \times \text{Aut}(C_{r_1+1} \times \dots \times C_r)$, where the product is direct since the actions of the two groups commute. Proceeding by induction on r we have $\text{Aut}(C_{r_1+1} \times \dots \times C_r) \cong (S_{r_2} \ltimes \text{Aut}(C_{r_2})^{r_2}) \times \dots \times (S_{r_k} \ltimes \text{Aut}(C_{r_k})^{r_k})$, and hence

$$\text{Aut}(C_1 \times \dots \times C_r) \cong S_{r_1} \ltimes (\text{Aut}(C_{r_1})^{r_1} \times (S_{r_2} \ltimes \text{Aut}(C_{r_2})^{r_2}) \times \dots \times (S_{r_k} \ltimes \text{Aut}(C_{r_k})^{r_k}))$$

To conclude it is enough to observe that the action of S_{r_1} commutes with the action of $S_{r_i} \ltimes \text{Aut}(C_{r_i})^{r_i}$ for any $i = 2, \dots, k$, but does not commute with the action of $\text{Aut}(C_{r_1})^{r_1}$. \square

Remark 4.7. In the proof of Lemma 4.6 we considered $\pi_i \circ \phi^{-1}$ instead of $\pi_i \circ \phi$ in order to make the map χ a morphism of groups. For the same reason, in similar settings, we will consider ϕ^{-1} instead of ϕ several times in the rest of the paper.

As an application of Theorem 4.2 we get the following result.

Proposition 4.8. *If either $n \neq 2$ or $\dim(X) \geq 2$, then the connected component of the identity of $\text{Aut}(X[n])$ is isomorphic to the connected component of the identity of $\text{Aut}(X)$, that is*

$$\text{Aut}^o(X[n]) \cong \text{Aut}^o(X)$$

for any n .

Proof. Let $g_n : X[n] \rightarrow X^n$ be the blow-up morphism in Proposition 1.3. Since g_n is birational we have $g_{n*}\mathcal{O}_{X[n]} \cong \mathcal{O}_{X^n}$, and we may apply Theorem 4.2 with $f = g_n$ and $G = \text{Aut}^o(X[n])$. Indeed, by Theorem 4.2 for any automorphism $\phi \in \text{Aut}^o(X[n])$ there exists an automorphism $\bar{\phi} \in \text{Aut}^o(X^n)$ such that the following diagram

$$\begin{array}{ccc} X[n] & \xrightarrow{\phi} & X[n] \\ g_n \downarrow & & \downarrow g_n \\ X^n & \xrightarrow{\bar{\phi}} & X^n \end{array}$$

is commutative. Now, let $x = (x, \dots, x) \in X^n$ be a point in the small diagonal $\Delta_{1, \dots, n}$, and assume that $\bar{\phi}(x) = y \notin \Delta_{1, \dots, n}$. Let F_x and F_y be the fibers of g_n over x and y respectively. Then ϕ restricts to an isomorphism $\phi|_{F_x} : F_x \rightarrow F_y$. On the other hand by Proposition 1.3 we know that $\dim(F_x) = (n-1)\dim(X) - 1$, while $y \notin \Delta_{1, \dots, n}$ yields $\dim(F_y) < (n-1)\dim(X) - 1$. A contradiction. Therefore, $\bar{\phi}$ restricts to an automorphism of $\Delta_{1, \dots, n} \cong X$, and we get a morphism of groups:

$$\begin{array}{ccc} \chi : \text{Aut}^o(X[n]) & \longrightarrow & \text{Aut}^o(X) \\ \phi & \longmapsto & \bar{\phi} \end{array}$$

Furthermore, by Lemma 4.5 $\bar{\phi}$ comes from the diagonal action of $\text{Aut}^o(X^n)$. Now, all the subvarieties of X^n blown-up in the construction of Proposition 1.3 are stabilized by the diagonal action of $\text{Aut}^o(X)$ on X^n . Therefore, by [Ha77, Corollary 7.15] this action lifts to an action of $\text{Aut}^o(X)$ on $X[n]$, and the morphism χ is surjective.

Finally, let $\phi \in \text{Aut}^o(X[n])$ such that $\chi(\phi) = \bar{\phi} = \text{Id}_{X^n}$. Then, the automorphism ϕ restricts to an automorphism of a general fiber of g_n . On the other hand, since g_n is birational such general fiber is a point. That is ϕ restricts to the identity on $X[n] \setminus \bigcup_{2 \leq |S| \leq n} g_n^{-1}(\Delta_S)$. By Remark 4.3 we conclude that ϕ is the identity, and χ is injective. \square

By Proposition 4.8 we have that if $n \neq 2$ then $\text{Aut}^o(\mathbb{P}^1[n]) \cong PGL(2)$. Thanks to the main result on dominant morphisms from $\mathbb{P}^1[n]$ to \mathbb{P}^1 in Section 2 we have the following stronger result.

Theorem 4.9. *The automorphism group of the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$ is given by*

$$\text{Aut}(\mathbb{P}^1[n]) \cong S_n \times PGL(2)$$

if $n \neq 2$. Furthermore, $\text{Aut}(\mathbb{P}^1[2]) \cong S_2 \ltimes (PGL(2) \times PGL(2))$.

Proof. Since $\mathbb{P}^1[1] \cong \mathbb{P}^1$ the statement is trivial for $n = 1$. If $n = 2$ it follows from Lemma 4.6. Now, let us consider the case $n \geq 3$. As usual we take an automorphism $\phi \in \text{Aut}(\mathbb{P}^1[n])$, and for any $i \in \{1, \dots, n\}$ we consider the composition $ev_i \circ \phi^{-1}$. By Proposition 2.10 the morphism $ev_i \circ \phi^{-1}$ factors either through an evaluation map ev_{j_i} or through a forgetful morphism $\pi_{i_1, \dots, i_{n-4}} \circ \rho$ of type (2.2).

Let us assume that $ev_i \circ \phi^{-1}$ factors through $\pi_{i_1, \dots, i_{n-4}} \circ \rho$. Then we have the following

$$\begin{array}{ccc} \mathbb{P}^1[n] & \xrightarrow{\phi^{-1}} & \mathbb{P}^1[n] \\ \pi_{i_1, \dots, i_{n-4}} \circ \rho \downarrow & & \downarrow ev_i \\ \overline{M}_{0,4} \cong \mathbb{P}^1 & \xrightarrow{\overline{\phi}} & \mathbb{P}^1 \end{array}$$

commutative diagram. Now, let $p \in \overline{M}_{0,4}$ be the point corresponding to the isomorphism class of a curve $[C = C_1 \cup C_2, (x_1, \dots, x_4)]$, where C_1, C_2 are smooth rational curves intersecting in one node, $x_1, x_2 \in C_1$ and $x_3, x_4 \in C_2$. Then $\pi_{i_1, \dots, i_{n-4}}^{-1}(p)$ is the union of $\sum_{k=0}^{n-4} \binom{n-4}{k}$ irreducible boundary divisors each one determined by a subset of $\{i_1, \dots, i_{n-4}\}$ labeling the marked points on C_1 . On the other hand, the general fiber of $\pi_{i_1, \dots, i_{n-4}} \circ \rho$ is irreducible. Now, to get a contradiction it is enough to recall that by Lemma 1.5 all the fibers of ev_i are isomorphic.

Therefore $ev_i \circ \phi^{-1}$ must factor through another evaluation map ev_{j_i} , and this yields a surjective morphism of groups

$$\begin{array}{ccc} \chi_n : \text{Aut}(\mathbb{P}^1[n]) & \longrightarrow & S_n \\ \phi & \longmapsto & \sigma_\phi \end{array}$$

where $\sigma_\phi(i) = j_i$. Since $ev_i \circ \phi^{-1} = \overline{\phi}_i \circ ev_{j_i}$ with $\overline{\phi}_i \in PGL(2)$, we have that

$$(ev_1 \times \dots \times ev_n) \circ \phi^{-1} = (\overline{\phi}_1 \times \dots \times \overline{\phi}_n) \circ (ev_{\sigma(1)} \times \dots \times ev_{\sigma(n)})$$

and the commutative diagram

$$\begin{array}{ccc} \mathbb{P}^1[n] & \xrightarrow{\phi^{-1}} & \mathbb{P}^1[n] \\ ev_{\sigma(1)} \times \dots \times ev_{\sigma(n)} \downarrow & & \downarrow ev_1 \times \dots \times ev_n \\ (\mathbb{P}^1)^n & \xrightarrow{\overline{\phi}_1 \times \dots \times \overline{\phi}_n} & (\mathbb{P}^1)^n \end{array}$$

Note that by Proposition 1.3 both $ev_1 \times \dots \times ev_n$ and $ev_{\sigma(1)} \times \dots \times ev_{\sigma(n)}$ are blow-ups of the the diagonals on $(\mathbb{P}^1)^n$ in order of increasing dimension. Arguing exactly as in the proof of Proposition 4.8 we see that $\overline{\phi}_1 \times \dots \times \overline{\phi}_n \in \text{Aut}((\mathbb{P}^1)^n)$ must preserve the diagonal

$\Delta_{1,\dots,n} \cong \mathbb{P}^1$, and therefore it yields an automorphism $\mu_\phi \in PGL(2)$. This induces a morphism of groups

$$\begin{aligned} \bar{\chi}_n : \text{Aut}(\mathbb{P}^1[n]) &\longrightarrow S_n \times PGL(2) \\ \phi &\longmapsto (\sigma_\phi, \mu_\phi) \end{aligned}$$

which, by Section 4.1 is surjective. Now assume that $\bar{\chi}_n(\phi)$ is the identity. Then arguing as in the proof of Proposition 4.8 we have that ϕ^{-1} stabilizes the general fiber of $ev_1 \times \dots \times ev_n$. On the other hand $ev_1 \times \dots \times ev_n$ is birational and hence ϕ^{-1} restricts to the identity on an open subset of $\mathbb{P}^1[n]$. To conclude it is enough to observe that Remark 4.3 forces $\phi^{-1} = \phi = Id_{\mathbb{P}^1[n]}$. \square

With similar arguments we can attack the automorphism group of $\overline{M}_{0,n}(\mathbb{P}^N, 1)$. Note that since the degree of the map is one there is a natural $PGL(2)$ action on $\overline{M}_{0,n}(\mathbb{P}^N, 1)$. Let $[C, (x_1, \dots, x_n), \alpha] \in \overline{M}_{0,n}(\mathbb{P}^N, 1)$ be a point, and let $\nu \in PGL(2)$.

There exists a unique component of C , say C_1 on which α has degree one. We consider the stable map $[\Gamma, (y_1, \dots, y_n), \alpha] \in \overline{M}_{0,n}(\mathbb{P}^N, 1)$ obtained by acting with ν on C_1 , and with the identity on the remaining components of C .

More precisely, let $p = C \cap \overline{C \setminus C_1}$, and let x_{i_1}, \dots, x_{i_k} be the marked points lying on C_1 . We consider the pointed curve $(C_1, (\nu(x_{i_1}), \dots, \nu(x_{i_k})))$ and we attach to it a copy of $\overline{C \setminus C_1}$ at $\nu(p)$. Letting the map α unvaried this gives us the stable map $[\Gamma, (y_1, \dots, y_n), \alpha]$, and therefore an action

$$(4.3) \quad PGL(2) \times \overline{M}_{0,n}(\mathbb{P}^N, 1) \longrightarrow \overline{M}_{0,n}(\mathbb{P}^N, 1)$$

which is trivial when $n = 0$, and coincides with (4.2) when $N = 1$.

Furthermore, if $n = 2$ we may define an action of $PGL(2) \times PGL(2)$ on $\overline{M}_{0,2}(\mathbb{P}^N, 1)$. Indeed, given $(\nu_1, \nu_2) \in PGL(2) \times PGL(2)$ we can map a general point $[\mathbb{P}^1, (x_1, x_2), \alpha] \in \overline{M}_{0,2}(\mathbb{P}^N, 1)$ to $[\mathbb{P}^1, (\nu_1(x_1), \nu_2(x_2)), \alpha]$. Note that a boundary point in $\overline{M}_{0,2}(\mathbb{P}^N, 1)$ necessarily represents a stable map of the form $[C_1 \cup C_2, (x_1, x_2), \alpha]$, where $x_1, x_2 \in C_2$ and α has degree one on C_1 . Now, we consider the curve C_1 with x_1 and x_2 collapsed in a point $x = x_1 = x_2$. If $\nu_1(x) \neq \nu_2(x)$ then the image of $[C_1 \cup C_2, (x_1, x_2), \alpha]$ will be $[C_1, (\nu_1(x), \nu_2(x)), \alpha]$. If $\nu_1(x) = \nu_2(x)$ then the image will be $[C_1 \cup C_2, (y_1, y_2), \alpha]$ where C_2 is a smooth rational curve with two marked points attached to C_1 at the point $\nu_1(x) = \nu_2(x)$. Finally, if we have a stable map of the type $[\mathbb{P}^1, (x_1, x_2), \alpha]$, and $\nu_1(x_1) = \nu_2(x_2)$ then we map such a stable map to $[C_1 \cup C_2, (y_1, y_2), \alpha]$, where $y_1, y_2 \in C_2$ and C_2 is attached to C_1 at $\nu_1(x_1) = \nu_2(x_2)$. In this way we get a well-defined regular action

$$(4.4) \quad (PGL(2) \times PGL(2)) \times \overline{M}_{0,2}(\mathbb{P}^N, 1) \longrightarrow \overline{M}_{0,2}(\mathbb{P}^N, 1)$$

which coincides with the action in Theorem 4.9 when $N = 1$.

Proposition 4.10. *If $N \geq 2$ then the connected component of the identity of the automorphism group of $\overline{M}_{0,n}(\mathbb{P}^N, 1)$ is given by*

$$\text{Aut}^o(\overline{M}_{0,n}(\mathbb{P}^N, 1)) \cong PGL(2) \times PGL(N+1)$$

for any $n \neq 2$. Furthermore, $\text{Aut}^o(\overline{M}_{0,2}(\mathbb{P}^N, 1)) \cong PGL(2) \times PGL(2) \times PGL(N+1)$.

Proof. Let us consider the forgetful morphism $\pi : \overline{M}_{0,n}(\mathbb{P}^N, 1) \rightarrow \overline{M}_{0,0}(\mathbb{P}^N, 1) \cong \mathbb{G}(1, N)$, where $\mathbb{G}(1, N)$ is the Grassmannian of lines in \mathbb{P}^N . By [Co89, Theorem 1.1] we have

$\text{Aut}^o(\mathbb{G}(1, N)) \cong PGL(N+1)$, and Theorem 4.2 yields a surjective morphism of groups

$$\begin{array}{ccc} \chi : \text{Aut}^o(\overline{M}_{0,n}(\mathbb{P}^N, 1)) & \longrightarrow & PGL(N+1) \\ \phi & \longmapsto & \overline{\phi} \end{array}$$

Note that $\pi : \overline{M}_{0,n}(\mathbb{P}^N, 1) \rightarrow \overline{M}_{0,0}(\mathbb{P}^N, 1) \cong \mathbb{G}(1, N)$ is a fibration with the Fulton-MacPherson configuration space $\mathbb{P}^1[n]$ as the fiber.

Now, if $\chi(\phi)$ is the identity then ϕ induces an automorphism of the fiber $\pi^{-1}([C, \alpha]) \cong \mathbb{P}^1[n]$ lying in $\text{Aut}^o(\mathbb{P}^1[n])$. By Theorem 4.9 we have that $\text{Aut}^o(\mathbb{P}^1[n]) \cong PGL(2)$ if $n \neq 2$, and $\text{Aut}^o(\mathbb{P}^1[2]) \cong PGL(2) \times PGL(2)$. Note that in any case $\text{Aut}^o(\mathbb{P}^1[n])$ may be embedded in $\text{Aut}^o(\overline{M}_{0,n}(\mathbb{P}^N, 1))$ via the actions (4.3) and (4.4) in the cases $n \neq 2$ and $n = 2$ respectively. Therefore, in any case we get an exact sequence

$$0 \mapsto \text{Aut}^o(\mathbb{P}^1[n]) \rightarrow \text{Aut}^o(\overline{M}_{0,n}(\mathbb{P}^N, 1)) \rightarrow PGL(N+1) \mapsto 0$$

To conclude it is enough to observe that by (4.2) the sequence above splits, and that the action (4.2) commutes with both the actions (4.3) and (4.4). \square

4.1.2. *Automorphisms of $C[n]$ and $\overline{M}_{g,n}$.* We can extend the main ideas in the computation of $\text{Aut}(\mathbb{P}^1[n])$ to $C[n]$ where C is smooth curve of genus $g(C) \geq 2$.

Proposition 4.11. *Let X be a smooth projective variety with nef canonical divisor, and let $\text{Aut}_\Delta(X^n) \subseteq \text{Aut}(X^n)$ be the subgroup of automorphisms stabilizing the union of all the diagonals of codimension greater than one in X^n . Then we have an isomorphism $\text{Aut}(X[n]) \cong \text{Aut}_\Delta(X^n)$.*

In particular, if $X \cong C$ is a curve of genus $g(C) \geq 2$ then

$$\text{Aut}(C[n]) \cong S_n \times \text{Aut}(C)$$

if $n \neq 2$, and $\text{Aut}(C[2]) \cong S_2 \ltimes (\text{Aut}(C) \times \text{Aut}(C))$.

Proof. The case $\dim(X) = 1$ and $n = 2$ is in Lemma 4.6. Let $g_n : X[n] \rightarrow X^n$ be the blow-up morphism in Proposition 1.3. For any $S = \{i_1, \dots, i_s\} \subset \{1, \dots, n\}$ we denote by $\Delta_S = \{(x_1, \dots, x_n) \in X^n \mid x_{i_1} = \dots = x_{i_s}\}$ the corresponding diagonal, and by $E_S \subset X[n]$ the exceptional divisor over Δ_S . If $\dim(X) \geq 2$ then the canonical divisor of $X[n]$ is given by

$$K_{X[n]} = g_n^* K_{X^n} + \sum_{2 \leq |S| \leq n} ((s-1) \dim(X) - 1) E_S$$

when $\dim(X) = 1$ and $n \geq 3$ the sum must be taken on the subsets S such that $3 \leq |S| \leq n$. However, this will not be relevant in our argument.

Let $\phi \in \text{Aut}(X[n])$ be an automorphism, and let us assume that the exceptional divisor E_S is not mapped to an exceptional divisor of g_n via ϕ . Let C be a general rational curve in E_S contracted by g_n , then $\phi(C)$ can not be contained in any exceptional divisor of g_n otherwise $\phi(E_S)$ would be contained in such an exceptional divisor as well. This yields

$$\left(\sum_{2 \leq |S| \leq n} ((s-1) \dim(X) - 1) E_S \right) \cdot \phi(C) \geq 0$$

Furthermore, since K_{X^n} is nef we have $g_n^* K_{X^n} \cdot \phi(C) = K_{X^n} \cdot g_{n*} \phi(C) \geq 0$, and hence $K_{X[n]} \cdot \phi(C) \geq 0$.

On the other hand, since ϕ is an automorphism we have

$$K_{X[n]} \cdot \phi(C) = \phi^* K_{X[n]} \cdot C = K_{X[n]} \cdot C$$

and since $g_n^* K_{X^n} \cdot C = 0$ we get

$$K_{X[n]} \cdot C = \sum_{2 \leq |S| \leq n} ((s-1) \dim(X) - 1) E_S \cdot C < 0$$

A contradiction. Therefore, $\phi|_{E_S}$ defines an isomorphism between E_S and an exceptional divisor $E_{S'}$. Let us consider the restrictions of the blow-up morphism $g_{n|E_S} : E_S \rightarrow \Delta_S$, and $g_{n|E_{S'}} : E_{S'} \rightarrow \Delta_{S'}$.

Now, let $y \in \Delta_{S'}$ be a general point, and $q \in g_{n|E_{S'}}^{-1}(y)$ a general point in the fiber F_q of $g_{n|E_{S'}}$ over y . Let F_p be the fiber of $g_{n|E_S}$ through $p = \phi^{-1}(q)$. Consider a rational curve $C \subseteq F_p$ passing through p , then $\phi(C)$ passes through $q \in F_q$. Assume that $\phi(C) \not\subseteq F_q$. Then $g_n(\phi(C)) \subset \Delta_{S'}$ is a rational curve through $y \in \Delta_{S'}$. This means that $\Delta_{S'}$ is uniruled. On the other hand $\Delta_{S'} \cong X^{n-|S'|+1}$, and by hypothesis K_X is nef. A contradiction.

We conclude that $\phi|_{E_S} : E_S \rightarrow E_{S'}$ maps isomorphically fibers of $g_{n|E_S}$ to fibers of $g_{n|E_{S'}}$. In particular $|S| = |S'|$. Hence ϕ induces an automorphism $\bar{\phi}$ fitting in the following commutative diagram

$$\begin{array}{ccc} X[n] & \xrightarrow{\phi} & X[n] \\ g_n \downarrow & & \downarrow g_n \\ X^n & \xrightarrow{\bar{\phi}} & X^n \end{array}$$

and furthermore $\bar{\phi}$ maps isomorphically any diagonal Δ_S to a diagonal of the same dimension, that is $\bar{\phi} \in \text{Aut}_\Delta(X^n)$. This yields a morphism of groups

$$\begin{array}{ccc} \text{Aut}(X[n]) & \longrightarrow & \text{Aut}_\Delta(X^n) \\ \phi & \longmapsto & \bar{\phi} \end{array}$$

which clearly is an isomorphism. Finally, if $X \cong C$ is a curve of genus $g(C) \geq 2$ and $n \neq 2$ the statement follows from Lemma 4.6. \square

Remark 4.12. Proposition 4.11 does not hold if C has genus one. For instance, the group $GL(2, \mathbb{Z})$ of matrices with integer entries and determinant plus or minus one acts on $C \times C$ via

$$\begin{array}{ccc} GL(2, \mathbb{Z}) \times (C \times C) & \longrightarrow & C \times C \\ \left(\begin{pmatrix} a_{1,1} & a_{1,2} \\ a_{2,1} & a_{2,2} \end{pmatrix}, (x_1, x_2) \right) & \longmapsto & (a_{1,1}x_1 \cdot a_{1,2}x_2, a_{2,1}x_1 \cdot a_{2,2}x_2) \end{array}$$

where $x \cdot y$, with $x, y \in C$, stands for the multiplication of the group law on C , and for $x \in C$, $a \in \mathbb{Z}$ we set $ax = x \cdot \dots \cdot x$, a -times.

Now let $X = C_1 \times \dots \times C_r$ be a product of curves. As in Lemma 4.6 we denote by $[C_{r_1}], \dots, [C_{r_k}]$ the isomorphism classes of curves in $\{C_1, \dots, C_r\}$, where r_i is the number of curves of class $[C_{r_i}]$. Let us consider the product X^n , and let (x_1^j, \dots, x_r^j) be the coordinates on the j -th copy of X , so that a point in X^n is given by (x_i^j) with $i = 1, \dots, r$, $j = 1, \dots, n$. We take into account the three following group actions on X^n :

$$(4.5) \quad \begin{array}{ccc} (S_{r_1} \times \dots \times S_{r_k}) \times X^n & \longrightarrow & X^n \\ (\sigma, (x_i^j)) & \longmapsto & ((x_{\sigma(1)}^1, \dots, x_{\sigma(r)}^1), \dots, (x_{\sigma(1)}^n, \dots, x_{\sigma(r)}^n)) \end{array}$$

where σ must be interpreted as a permutation $\sigma \in S_{r_1} \times \dots \times S_{r_k} \subseteq S_r$.

$$(4.6) \quad \begin{array}{ccc} S_n^r \times X^n & \longrightarrow & X^n \\ (\sigma_1, \dots, \sigma_r, (x_i^j)) & \longmapsto & ((x_1^{\sigma_1(1)}, \dots, x_r^{\sigma_r(1)}), \dots, (x_1^{\sigma_1(n)}, \dots, x_r^{\sigma_r(n)})) \end{array}$$

$$(4.7) \quad \begin{array}{ccc} \bigoplus_{i=1}^n \text{Aut}(C_i) \times X^n & \longrightarrow & X^n \\ (\alpha_1, \dots, \alpha_r, (x_i^j)) & \longmapsto & ((\alpha_1(x_1^1), \dots, \alpha_r(x_r^1)), \dots, (\alpha_1(x_1^n), \dots, \alpha_r(x_r^n))) \end{array}$$

Proposition 4.13. *Let $X = C_1 \times \dots \times C_r$ be a product of curves with $g(C_i) \geq 2$ for any $i = 1, \dots, r$, and let $[C_{r_1}], \dots, [C_{r_k}]$ be the isomorphism classes of curves in $\{C_1, \dots, C_r\}$, where r_i is the number of curves of class $[C_{r_i}]$. If $n \neq 2$ then*

$$\text{Aut}(X[n]) \cong S_n \times ((S_{r_1} \times \text{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \times \text{Aut}(C_{r_k})^{r_k})) \cong S_n \times \text{Aut}(X)$$

while if $n = 2$ and $r \geq 2$ we have

$$\text{Aut}(X[2]) \cong S_2^r \times ((S_{r_1} \times \text{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \times \text{Aut}(C_{r_k})^{r_k})) \cong S_2^r \times \text{Aut}(X)$$

Finally, if $n = 2$ and $r = 1$ then $X = C_1$, and $\text{Aut}(C_1[2]) \cong S_2 \times (\text{Aut}(C_1) \times \text{Aut}(C_1))$.

Proof. The case $n = 2, r = 1$ is just the last part of Proposition 4.11. Now, by Proposition 4.11 we may identify $\text{Aut}(X[n])$ with the subgroup $\text{Aut}_\Delta(X^n) \subseteq \text{Aut}(X^n)$ of automorphisms stabilizing the union of all the diagonals of codimension greater than one in X^n .

Note that X^n is just a product of curves, and by Lemma 4.6 we know the structure of its automorphism group. The actions (4.5) and (4.7) yield an injective morphism $i : (S_{r_1} \times \text{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \times \text{Aut}(C_{r_k})^{r_k}) \hookrightarrow \text{Aut}_\Delta(X^n)$. Now, by Lemma 4.6 $\text{coker}(i)$ is forced to be a subgroup of the group S_n^r in (4.6).

If $n = 2, r \geq 2$. Then any automorphism in (4.6) preserves the diagonal $\Delta_{1,2}$, that is $\text{coker}(i) \cong S_2^r$. To conclude it is enough to observe that (4.6) induces a section $S_2^r \rightarrow \text{Aut}_\Delta(X^n)$.

If $n \neq 2$ then $(\sigma_1, \dots, \sigma_r)$ preserves the union of all the diagonals $\Delta \subset X^n$ if and only if $\sigma_1 = \dots = \sigma_r$. This yields that $\text{coker}(i) \cong S_n$ is given by the diagonal action of S_n in (4.6). Again we have a section $S_n \rightarrow \text{Aut}_\Delta(X^n)$, and to conclude it is enough to observe the the actions of S_n and $(S_{r_1} \times \text{Aut}(C_{r_1})^{r_1}) \times \dots \times (S_{r_k} \times \text{Aut}(C_{r_k})^{r_k})$ commute. \square

Let $\overline{M}_{g,n}$ be the Deligne-Mumford compactification of the moduli space $M_{g,n}$ parametrizing smooth genus g curves with n marked points. Thanks to Proposition 4.11 we can provide a simple proof of the main theorem on $\text{Aut}(\overline{M}_{g,n})$ in [Ma14] when $g \geq 3$.

Corollary 4.14. *If $g \geq 3$ then $\text{Aut}(\overline{M}_{g,n}) \cong S_n$ for any $n \geq 1$.*

Proof. Let $\phi \in \text{Aut}(\overline{M}_{g,n})$ be an automorphism. By [GKM02, Theorem 0.9] for any forgetful morphism $\pi_i : \overline{M}_{g,n} \rightarrow \overline{M}_{g,n-1}$ the composition $\pi_i \circ \phi^{-1} : \overline{M}_{g,n} \rightarrow \overline{M}_{g,n-1}$ factors through a forgetful morphism $\pi_{\sigma(i)} : \overline{M}_{g,n} \rightarrow \overline{M}_{g,n-1}$. Therefore, we get the following commutative diagram

$$\begin{array}{ccc} \overline{M}_{g,n} & \xrightarrow{\phi^{-1}} & \overline{M}_{g,n} \\ \pi_{\sigma_\phi(1)} \times \dots \times \pi_{\sigma_\phi(n)} \downarrow & & \downarrow \pi_1 \times \dots \times \pi_n \\ \overline{M}_g & \xrightarrow{\overline{\phi}} & \overline{M}_g \end{array}$$

and the surjective morphism of groups

$$\begin{array}{ccc} \chi : \text{Aut}(\overline{M}_{g,n}) & \longrightarrow & S_n \\ \phi & \longmapsto & \sigma_\phi \end{array}$$

Let $[C] \in \overline{M}_g$ be a general point, and let $[\Gamma] = \overline{\phi}([C])$. Note that since both C and Γ have a trivial automorphism group, the fibers of $\pi_{\sigma_\phi(1)} \times \dots \times \pi_{\sigma_\phi(n)}$ over $[C]$ and of $\pi_1 \times \dots \times \pi_n$ over $[\Gamma]$ are nothing but the Fulton-MacPherson configuration spaces $C[n]$ and $\Gamma[n]$ respectively. Therefore, ϕ^{-1} induces an isomorphism between $C[n]$ and $\Gamma[n]$, and this yields $C \cong \Gamma$, and $\overline{\phi} = Id_{\overline{M}_g}$. Now, if $\chi(\sigma)$ is the trivial permutation then ϕ restricts to an automorphism of the general fiber $C[n]$ of $\pi_1 \times \dots \times \pi_n$.

By Proposition 4.11 $\phi|_{C[n]}$ acts as a combination of a permutation and an automorphism of C . On the other hand, since $\phi \in \ker(\chi)$ the permutation must be trivial, and since C is a general curve of genus $g \geq 3$ then $\text{Aut}(C)$ is trivial as well.

This means that ϕ restricts to the identity on the general fiber of $\pi_1 \times \dots \times \pi_n$. To conclude it is enough to recall Remark 4.3. \square

4.2. Kontsevich spaces parametrizing rational normal curves. Let us consider the Kontsevich space $\overline{M}_{0,n+3}(\mathbb{P}^n, n)$ parametrizing degree n rational normal curves in \mathbb{P}^n . It is well known that through $n+3$ general points in \mathbb{P}^n there is a unique rational normal curve of degree n , that is the evaluation morphism

$$ev := ev_1 \times \dots \times ev_{n+3} : \overline{M}_{0,n+3}(\mathbb{P}^n, n) \rightarrow (\mathbb{P}^n)^{n+3}$$

is birational. Therefore, we may adapt the argument in the proof of Proposition 4.8 to prove that the connected component of the identity of $\text{Aut}(\overline{M}_{0,n+3}(\mathbb{P}^n, n))$ is isomorphic to $PGL(n+1)$. However, a little improvement is at hand if we take into account Kapranov's construction of the moduli space of Deligne-Mumford stable n -pointed rational curves $\overline{M}_{0,n}$. Thanks to Theorem 1.6 we may consider $\overline{M}_{0,n+2}(\mathbb{P}^n, n)$ instead of $\overline{M}_{0,n+3}(\mathbb{P}^n, n)$ in order to prove the following result.

Proposition 4.15. *For any $n \geq 3$ and $k \geq n+2$ we have $\text{Aut}^o(\overline{M}_{0,k}(\mathbb{P}^n, n)) \cong PGL(n+1)$.*

Proof. By Theorem 1.6 the morphism

$$\rho \times ev_1 \times \dots \times ev_{n+2} : \overline{M}_{0,n+2}(\mathbb{P}^n, n) \rightarrow \overline{M}_{0,n+2} \times (\mathbb{P}^n)^n$$

is an isomorphism on the open subset of $(\mathbb{P}^n)^n$ parametrizing points in linear general position, and the projection on $(\mathbb{P}^n)^n$

$$\begin{array}{ccc} \overline{M}_{0,n+2}(\mathbb{P}^n, n) & \xrightarrow{\rho \times ev_1 \times \dots \times ev_{n+2}} & \overline{M}_{0,n+2} \times (\mathbb{P}^n)^n \\ & \searrow \pi & \downarrow \pi_2 \\ & & (\mathbb{P}^n)^n \end{array}$$

gives a fibration π of $\overline{M}_{0,n+2}(\mathbb{P}^n, n)$ whose general fiber is isomorphic to $\overline{M}_{0,n+2}$. Since $\rho \times ev_1 \times \dots \times ev_{n+2}$ is birational, and π_2 is a morphism with connected fibers between smooth varieties we have $\pi_* \mathcal{O}_{\overline{M}_{0,n+2}(\mathbb{P}^n, n)} \cong \mathcal{O}_{(\mathbb{P}^n)^n}$. Therefore, we may apply Theorem 4.2 with $G = \text{Aut}^o(\overline{M}_{0,n+2}(\mathbb{P}^n, n))$ and $f = \pi$. For any $\phi \in \text{Aut}^o(\overline{M}_{0,n+2}(\mathbb{P}^n, n))$ this yields an

automorphism $\bar{\phi} \in \text{Aut}^o((\mathbb{P}^n)^n)$ such that the diagram

$$\begin{array}{ccc} \overline{M}_{0,n+2}(\mathbb{P}^n, n) & \xrightarrow{\phi} & \overline{M}_{0,n+2}(\mathbb{P}^n, n) \\ \pi \downarrow & & \downarrow \pi \\ (\mathbb{P}^n)^n & \xrightarrow{\bar{\phi}} & (\mathbb{P}^n)^n \end{array}$$

is commutative. Now, note that for any $(p_1, \dots, p_n) \in (\mathbb{P}^n)^n$ there is a dense open subset of the fiber $F_{p_1, \dots, p_n} = \pi^{-1}(p_1, \dots, p_n)$ parametrizing rational normal curves in \mathbb{P}^n through p_1, \dots, p_n . Let $x = (x, \dots, x) \in (\mathbb{P}^n)^n$ be a point in the small diagonal $\Delta_{1, \dots, n} \cong \mathbb{P}^n$, and let $F_x = \pi^{-1}(x)$. Note that $y \in (\mathbb{P}^n)^n \setminus \Delta_{1, \dots, n}$ forces $\dim(F_y) < \dim(F_x)$, where $F_y = \pi^{-1}(y)$. Therefore, $\bar{\phi}$ restricts to an automorphism of $\Delta_{1, \dots, n} \cong \mathbb{P}^n$, and we get a morphism of groups

$$\begin{array}{ccc} \chi : \text{Aut}^o(\overline{M}_{0,n+2}(\mathbb{P}^n, n)) & \longrightarrow & PGL(n+1) \\ \phi & \longmapsto & \bar{\phi} \end{array}$$

Furthermore, by Section 4.1 χ is surjective. Finally we prove that χ is also injective. If $\bar{\phi} = \chi(\phi) = Id_{\mathbb{P}^n}$ then ϕ restricts to an automorphism of the general fiber of π . We know that such a general fiber is isomorphic to $\overline{M}_{0,n+2}$. Now, by [BM13, Theorem 3] the automorphism group of $\overline{M}_{0,n+2}$ is isomorphic to the symmetric group S_{n+2} for any $n \geq 3$. This means that ϕ restricts to a permutation in S_{n+2} on the general fiber of π , and since ϕ is in the connected component of the identity it must restrict to the trivial permutation on such a general fiber. Again to conclude it is enough to recall Remark 4.3. Finally, since $n \geq 3$ we have $n+2 \geq 5$ and by Lemma 4.4 we conclude that $\text{Aut}^o(\overline{M}_{0,k}(\mathbb{P}^n, n)) \cong PGL(n+1)$ for $k \geq n+2$. \square

The following result is the key to relate the automorphisms of the coarse moduli space $\overline{M}_{0,n}(\mathbb{P}^N, d)$ with those of the stack $\overline{\mathcal{M}}_{0,n}(\mathbb{P}^N, d)$.

Lemma 4.16. *Let \mathcal{X} be a separated Deligne-Mumford stack over an affine scheme S with trivial general stabilizer, and let X be its coarse moduli space. Then there exists an injective morphism of groups*

$$\chi : \text{Aut}(\mathcal{X}/S) \rightarrow \text{Aut}(X/S)$$

Proof. Since the natural map $\pi : \mathcal{X} \rightarrow X$ is universal for morphisms in schemes for any $\phi \in \text{Aut}(\mathcal{X}/S)$ we get a unique $\tilde{\phi} \in \text{Aut}(X/S)$ commuting with π . This correspondence induces the morphism χ . Since \mathcal{X} has trivial general stabilizer there is an open substack $\mathcal{U} \subseteq \mathcal{X}$ which is isomorphic to its image $U \subseteq X$. If $\phi \in \text{Aut}(\mathcal{X}/S)$ satisfies $\chi(\phi) = Id_X$ we get that $\phi|_{\mathcal{U}} = Id_{\mathcal{U}}$ and by separateness this implies that $\phi = Id_{\mathcal{X}}$. \square

Corollary 4.17. *For any $n \geq 3$ and $k \geq n+2$ we have $\text{Aut}^o(\overline{\mathcal{M}}_{0,k}(\mathbb{P}^n, n)) \cong PGL(n+1)$.*

Proof. Since $\overline{\mathcal{M}}_{0,k}(\mathbb{P}^n, n)$ is a smooth Deligne-Mumford stack with trivial general stabilizer it is enough to apply Proposition 4.15 and Lemma 4.16. \square

4.3. A conjecture on the automorphism group of $X[n]$. From Proposition 1.3 it is clear that the diagonal action of $S_n \times \text{Aut}(X)$ on X^n lifts to the Fulton-MacPherson compactification $X[n]$. It is natural to ask whether this action gives the full automorphism group of $X[n]$.

By Proposition 4.11 when K_X is nef we may hope to control the automorphisms of $X[n]$.

On the other hand, Remark 4.12 shows that when X is abelian we should expect the automorphisms of $X[n]$ to behave less nicely from our point of view.

Furthermore, by [HMX13] if X is of general type then its group of birational automorphisms $\text{Bir}(X)$, and a fortiori $\text{Aut}(X)$ are finite. Therefore, we may expect the subgroup $\text{Aut}_\Delta(X^n) \subseteq \text{Aut}(X^n)$ in Proposition 4.11 of automorphisms stabilizing the union of all the diagonals of codimension greater than one in X^n to be just $S_n \times \text{Aut}(X)$. This leads us to the following conjecture.

Conjecture 4.18. *Let X be a smooth projective variety of general type. If $n \neq 2$ then*

$$\text{Aut}(X[n]) \cong S_n \times \text{Aut}(X)$$

Note that when $X = C$ is a curve this is just Proposition 4.11, and more generally when $X = C_1 \times \dots \times C_r$ is a product of curves with $g(C_i) \geq 2$ for any i this is Proposition 4.13. On the other hand, the second part of Proposition 4.13 tells us that additional symmetries are allowed when $n = 2$.
